

# Robot Framework

## tutorialspoint

SIMPLY EASY LEARNING

[www.tutorialspoint.com](http://www.tutorialspoint.com)

<https://www.facebook.com/tutorialspointindia>

<https://twitter.com/tutorialspoint>

## About the Tutorial

---

**Robot Framework** is an open source test automation framework for acceptance testing and acceptance test-driven development. It follows different test case styles – keyword-driven, behaviour-driven and data-driven for writing test cases. This feature makes it very easy to understand. Test cases are written using keyword style in a tabular format. Robot Framework provides good support for external libraries, tools that are open source and can be used for automation. The most popular library used with Robot Framework is Selenium Library used for web development & UI testing.

## Audience

---

This tutorial is designed for software programmers/testers, who want to learn the basics of Robot Framework automation testing in simple and easy ways. This tutorial will give you enough understanding on various functionalities of Robot Framework with suitable examples.

## Prerequisites

---

Before proceeding with this tutorial, you should have a basic understanding of testing concepts.

# 1. Robot Framework — Overview

**Robot Framework** is an open source test automation framework for acceptance testing and acceptance test-driven development. It follows different test case styles – keyword-driven, behaviour-driven and data-driven for writing test cases. Robot Framework provides support for external libraries, tools which are open source and can be used for automation. The most popular library used is Selenium Library used for web development & UI testing.

Test cases are written using keyword style in a tabular format. You can use any text editor or Robot Integrated Development Environment (RIDE) for writing test cases.

Robot framework works fine on all the Operating Systems available. The framework is built on Python and runs on Jython (JVM) and IronPython (.NET).

## Robot Framework Features

---

In this section, we will look at the different features offered by Robot.

### Tabular format for test cases

Robot framework comes with a simple tabular format where the test cases are written using keywords. It is easy for a new developer to understand and write test cases.

### Keywords

Robot framework comes with built-in keywords available with robot framework, keywords available from the libraries like Selenium Library (open browser, close browser, maximize browser, etc.). We can also create user-defined keywords, which are a combination of other user-defined keywords or built-in or library keywords. We can also pass arguments to those keywords, which make the user-defined keywords like functions that can be reused.

### Variables

Robot framework supports variables – scalar, list and dict. Variables in robot framework are easy to use and are of great help while writing complex test cases.

### Libraries

Robot framework has support for a lot of external libraries like SeleniumLibrary, Database Library, FTP Library and http library. SeleniumLibrary is mostly used as it helps to interact with the browsers and helps with web application and UI testing. Robot framework also has its own built-in libraries for strings, date, numbers etc.

### Resources

Robot framework also allows the import of robot files with keywords externally to be used with test cases. Resources are very easy to use and are of great help when we need to use some keywords already written for other test projects.

## Data driven test cases

Robot framework supports keyword driven style test cases and data driven style. Data driven works with high-level keyword used as a template to the test suite and the test cases are used to share data with the high-level keyword defined in the template. It makes the work very easy for testing UI with different inputs.

## Test Case Tagging

Robot framework allows to tag test-cases so that we can either run the tags test-cases or skip the tagged testcases. Tagging helps when we want to run only a group of test cases or skip them.

## Reports and Logs

Robot framework provides all the details of test suite, test case execution in the form of report and logs. All the execution details of the test case are available in the log file. The details like whether the test case has failed or passed, time taken for execution, steps followed to run the test case are provided.

## RIDE

This editor available with Robot framework helps in writing and running test cases. The editor is very easy to install and use. RIDE makes life easy for writing test cases by providing framework specific code completion, syntax highlighting, etc. Creation of project, test suite, test case, keywords, variables, importing library, executing, tagging the test case is easily done in the editor. Robot framework also provides plugins for eclipse, sublime, Textmate, Pycharm that has support for robot test cases.

## Robot Framework Advantages

Robot framework is open source, so anyone who wants to try out can easily do so.

- It is very easy to install and helps in creating and executing test cases. Any new comer can easily understand and does not need any high level knowledge of testing to get started with robot framework.
- It supports keyword-driven, behaviour-driven and data-driven style of writing test cases.
- It is a good support for external libraries. Most used is Selenium Library, which is easy to install and use in robot framework.

## Robot Framework Limitations

Robot lacks support for if-else, nested loops, which are required when the code gets complex.

## Conclusion

---

Robot Framework is an open source test automation framework for acceptance testing and acceptance test-driven development. The test cases in Robot Framework are based on keywords written in tabular format, which makes it clear and readable, and conveys the right information about the intention of the test case. For example, to open browser, the keyword used is **"Open Browser"**.

## 2. Robot Framework — Environment Setup

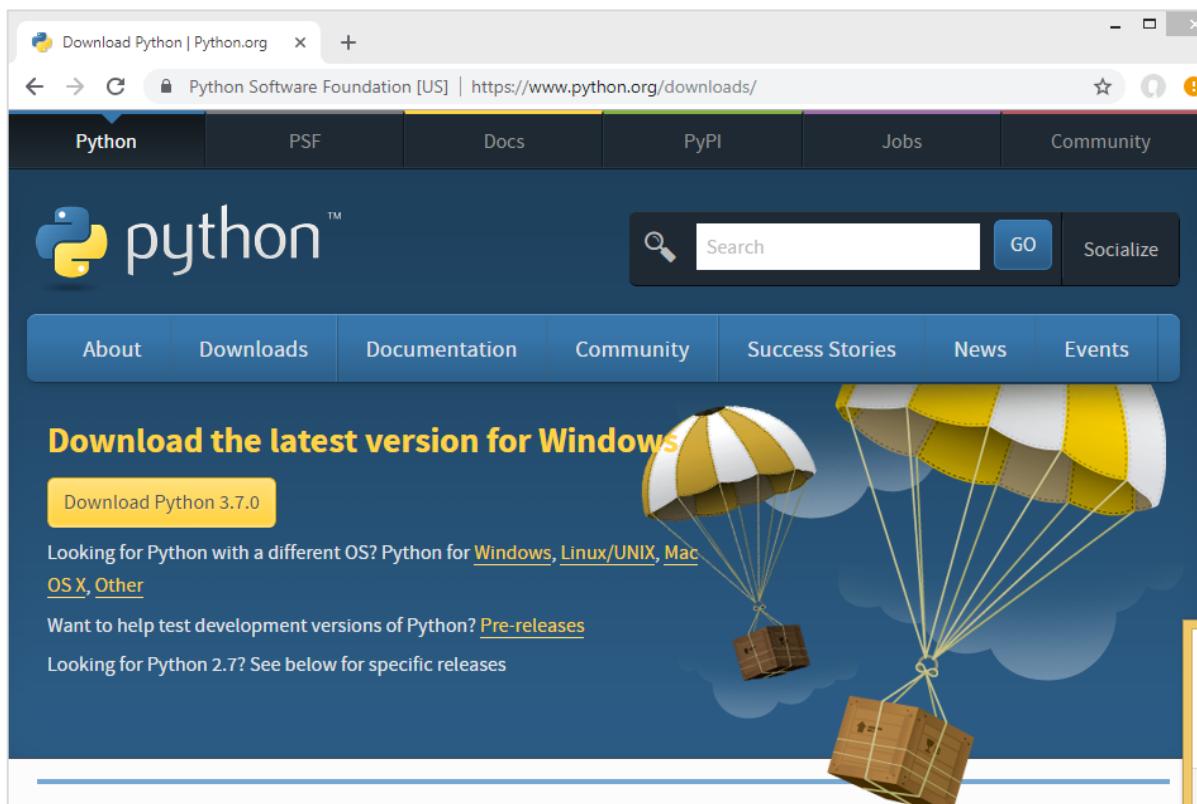

Robot framework is built using python. In this chapter, we will learn how to set up Robot Framework. To work with Robot Framework, we need to install the following:

- Python
- pip
- Robot Framework
- wxPython for Ride IDE
- Robot Framework Ride

### Install Python

To install python, go to python official site: <https://www.python.org/downloads/> and download the latest version or the prior version of python as per your operating system (Windows, Linux/Unix, Mac, and OS X) you are going to use.

Here is the screenshot of the python download site:

The latest version available as per release dates are as follows:

Release version	Release date		Click for more
<a href="#">Python 3.5.6</a>	2018-08-02	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.4.9</a>	2018-08-02	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.7.0</a>	2018-06-27	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.6.6</a>	2018-06-27	Download	<a href="#">Release Notes</a>
<a href="#">Python 2.7.15</a>	2018-05-01	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.6.5</a>	2018-03-28	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.4.8</a>	2018-02-05	Download	<a href="#">Release Notes</a>
<a href="#">Python 3.5.5</a>	2018-02-05	Download	<a href="#">Release Notes</a>

[View older releases](#)

Before you download python, it is recommended you check your system if python is already present by running the following command in the command line:

## Windows Installation

```
python --version
```

```
C:\>python --version
'python' is not recognized as an internal or external command,
operable program or batch file.

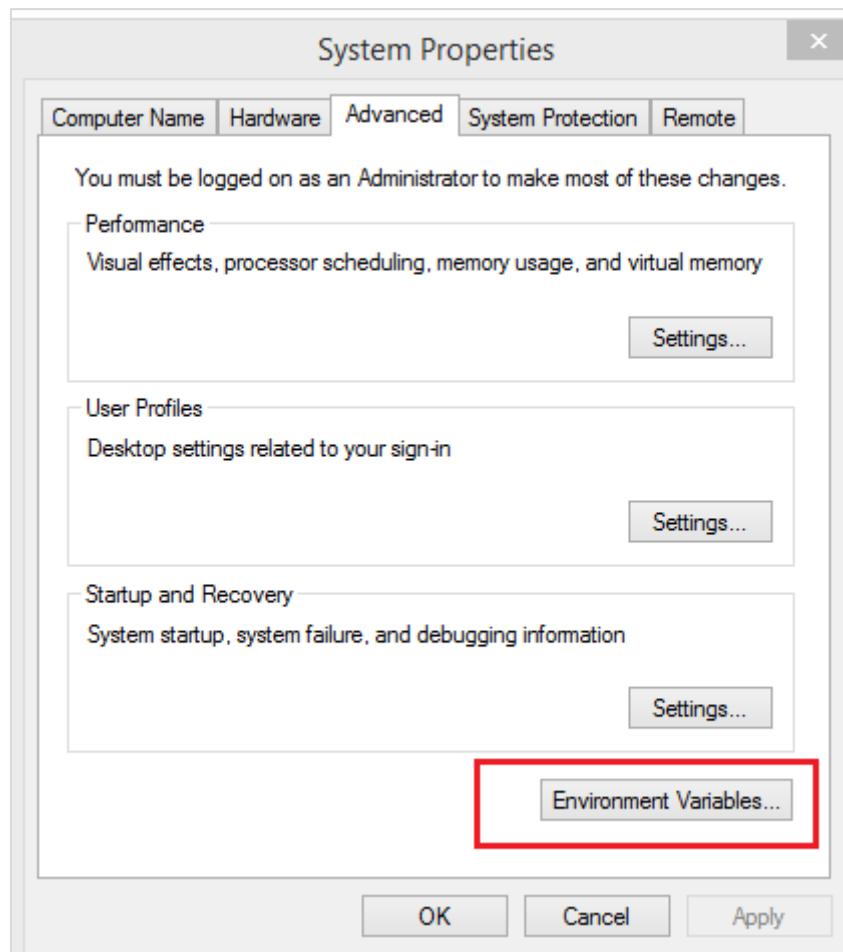

C:\>_
```

If we get the version of python as output then, we have python installed in our system. Otherwise, you will get a display as shown above.

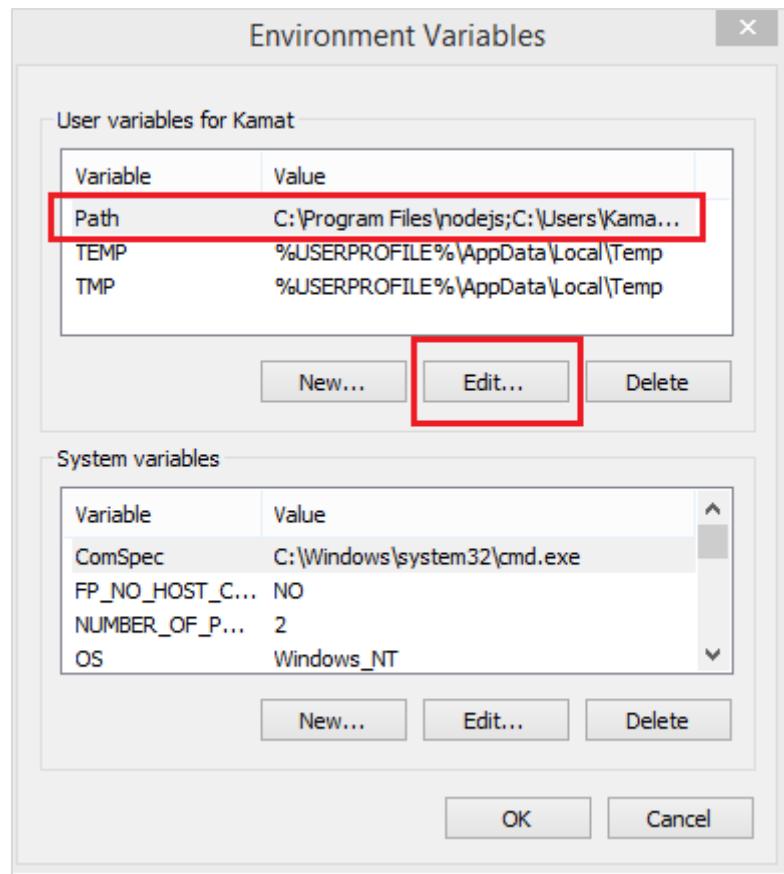

Here, we will download python version 2.7 as it is compatible to the windows 8 we are using right now. Once downloaded, install python on your system by double-clicking on .exe python download. Follow the installation steps to install Python on your system. Once installed, to make python available globally, we need to add the path to environment variables in windows as follows:

## Setting path for Windows

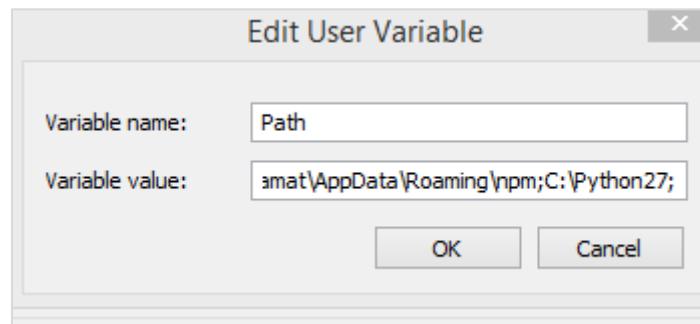

Right-click on My Computer icon and select properties. Click on Advanced System setting and the following screen will be displayed.

Click on *Environment Variables* button highlighted above and it will show you the screen as follows:

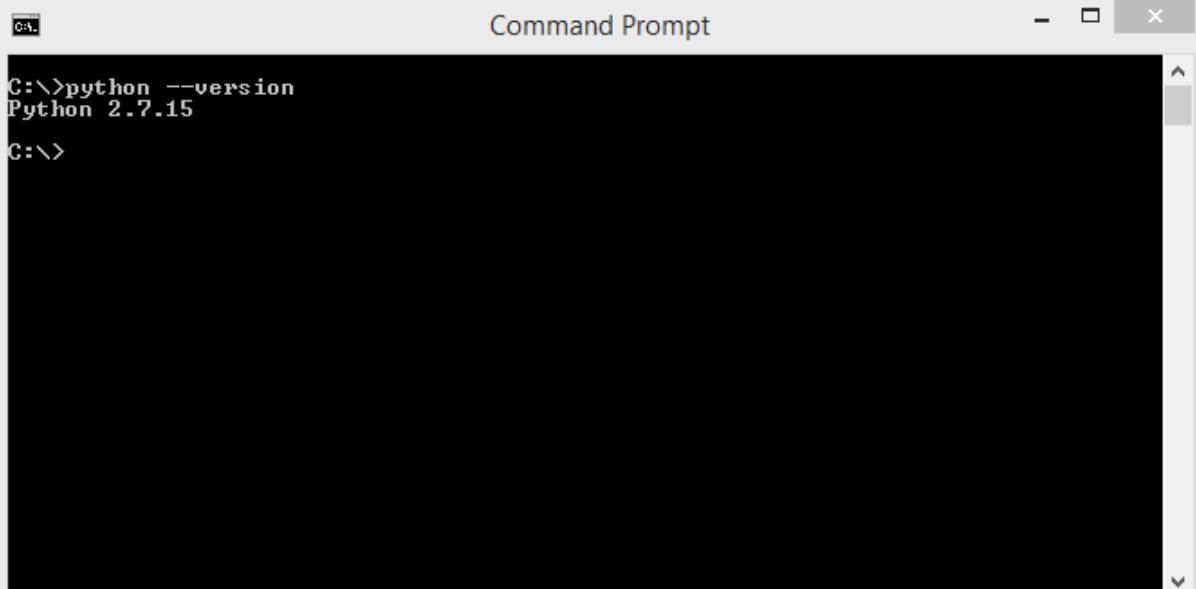

Select the *Variable Path* and click the *Edit* button.

Get the path where python is installed and add the same to *Variable value* at the end as shown above.

Once this is done, you can check if python is installed from any path or directory as shown below:

```
C:\>python --version
Python 2.7.15
C:\>
```

### 3. Robot – UNIX and Linux Installation

Let us now see a few simple steps to install Python on Unix/Linux machine. Open a Web browser and go to <https://www.python.org/downloads/>.

- Follow the link to download zipped source code available for Unix/Linux.
- Download and extract files.
- Editing the *Modules/Setup* file if you want to customize some options.
- run *./configure* script
- *make*
- *make install*

This installs Python at standard location */usr/local/bin* and its libraries at */usr/local/lib/pythonXX* where XX is the version of Python.

#### **Setting Path at Unix/Linux**

---

To add the Python directory to the path for a particular session in Unix –

##### **In the csh shell**

type *setenv PATH "\$PATH:/usr/local/bin/python"* and press Enter.

##### **In the bash shell (Linux)**

type *export PATH="\$PATH:/usr/local/bin/python"* and press Enter.

##### **In the sh or ksh shell**

type *PATH="\$PATH:/usr/local/bin/python"* and press Enter.

Note – */usr/local/bin/python* is the path of the Python directory

#### **Install PIP**

---

Now, we will check for the next step, which is pip installation for python. PIP is a package manager to install modules for python.

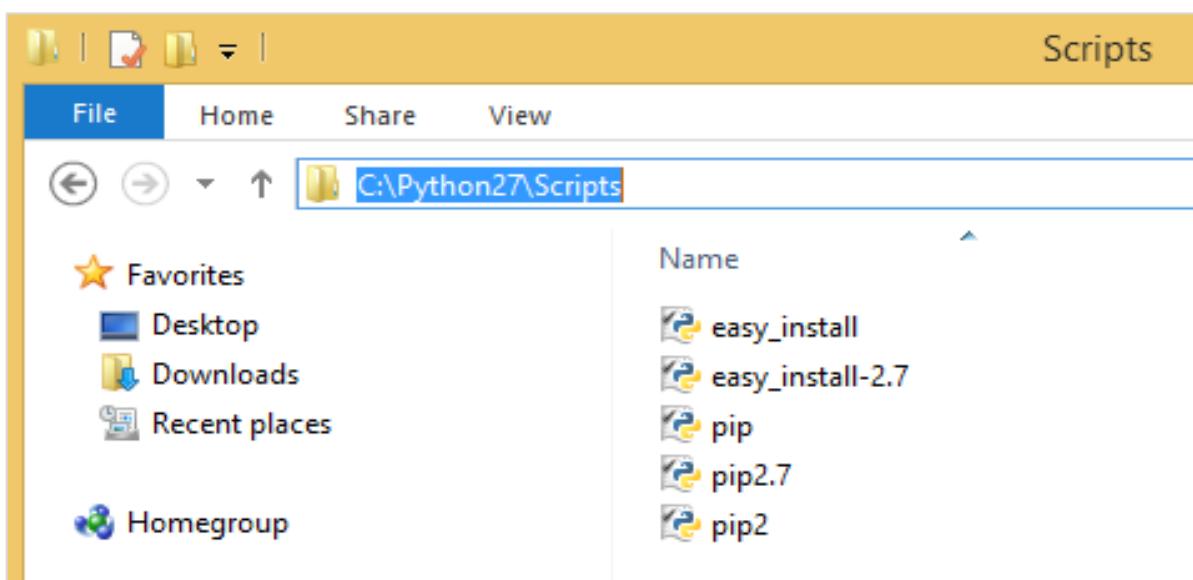

PIP gets installed along with python and you can check the same in command line as follows:

##### **Command**

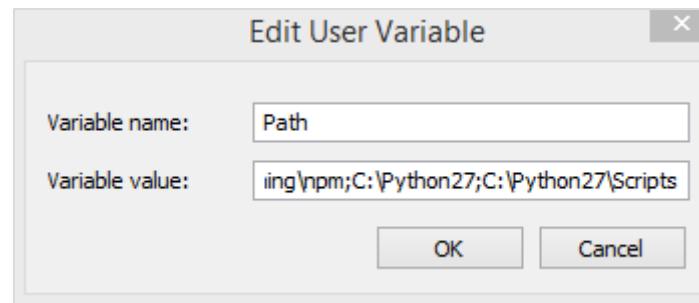

```
pip --version
```

```
C:\>pip --version
'pip' is not recognized as an internal or external command,
operable program or batch file.
```

Here we are still not getting the version for pip. We need to add the pip path to Environment variables so that we can use it globally. PIP will be installed in Scripts folder of python as shown below:

Go back to environment variables and add the path of pip to the variables list. Add C:\Python27\SCripts to environment variables as follows:

Now open your command line and check the version of pip installed:

```
C:\>pip --version
pip 9.0.3 from c:\python27\lib\site-packages (python 2.7)
C:\>
```

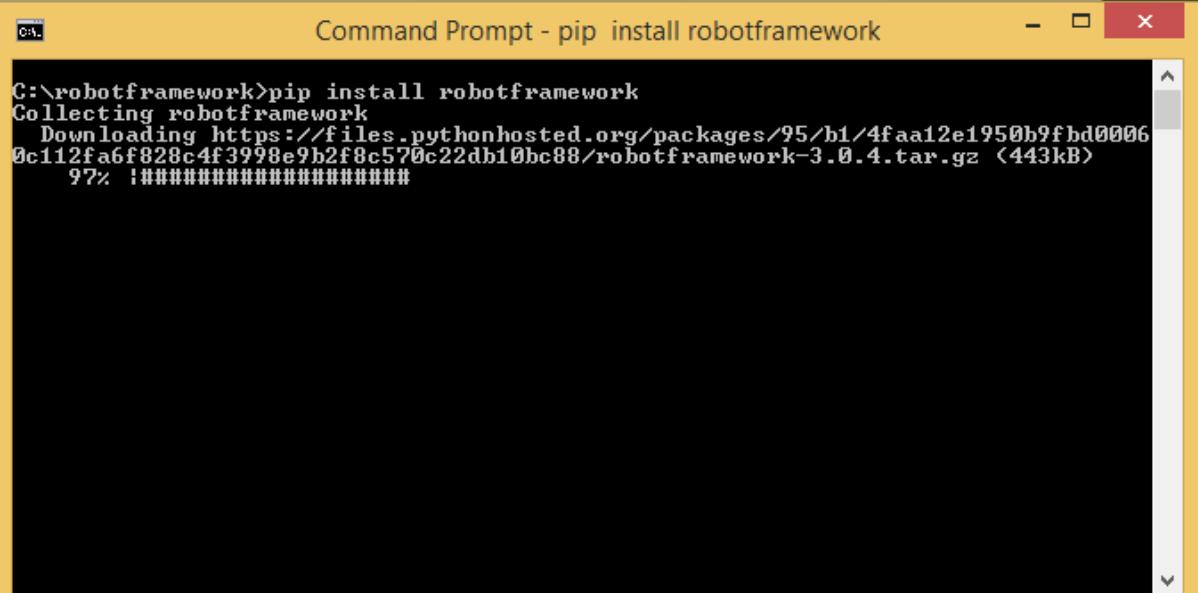

So now, we have python and pip installed.

## Install Robot Framework

We will now use pip – python package manager to install the robot framework and the command for it is as follows:

### Command

```
pip install robotframework
```

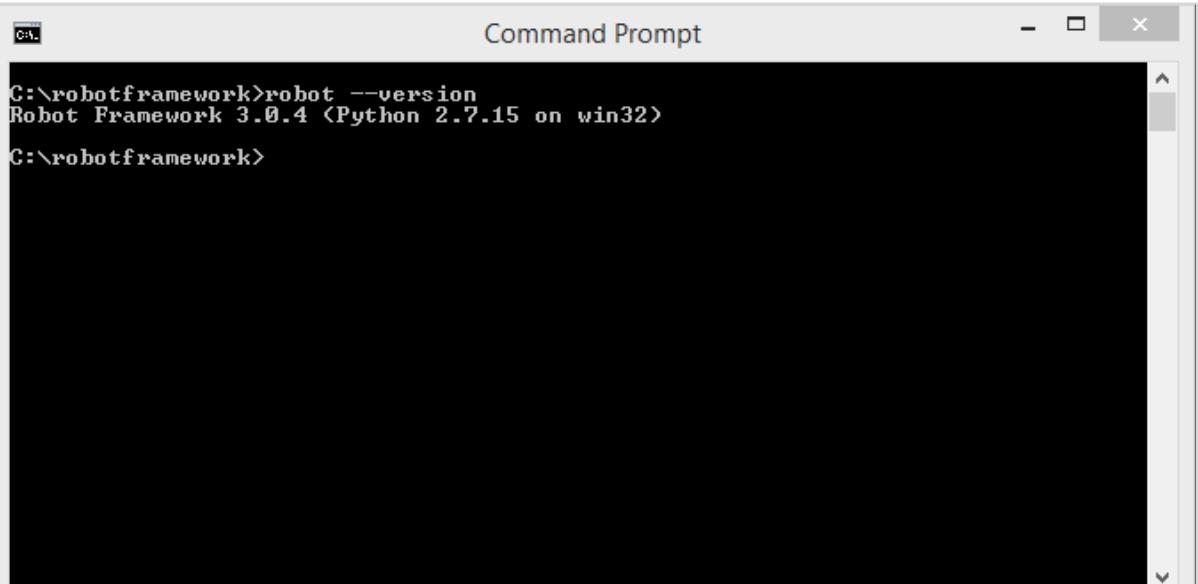

Command Prompt - pip install robotframework

```
C:\robotframework>pip install robotframework
Collecting robotframework
  Downloading https://files.pythonhosted.org/packages/95/h1/4faa12e1950b9fbd00060c112fa6f828c4f3998e9b2f8c570c22db10bc88/robotframework-3.0.4.tar.gz (443kB)
    97% #####
```

Once the installation is done, you can check the version of robot framework installed as shown below:

## Command

```
robot --version
```

Command Prompt

```
C:\robotframework>robot --version
Robot Framework 3.0.4 (Python 2.7.15 on win32)
C:\robotframework>
```

So, we can see Robot Framework 3.0.4 is installed.

## Install wxPython

We need wxPython for Robot Framework Ride, which is an IDE for Robot Framework.

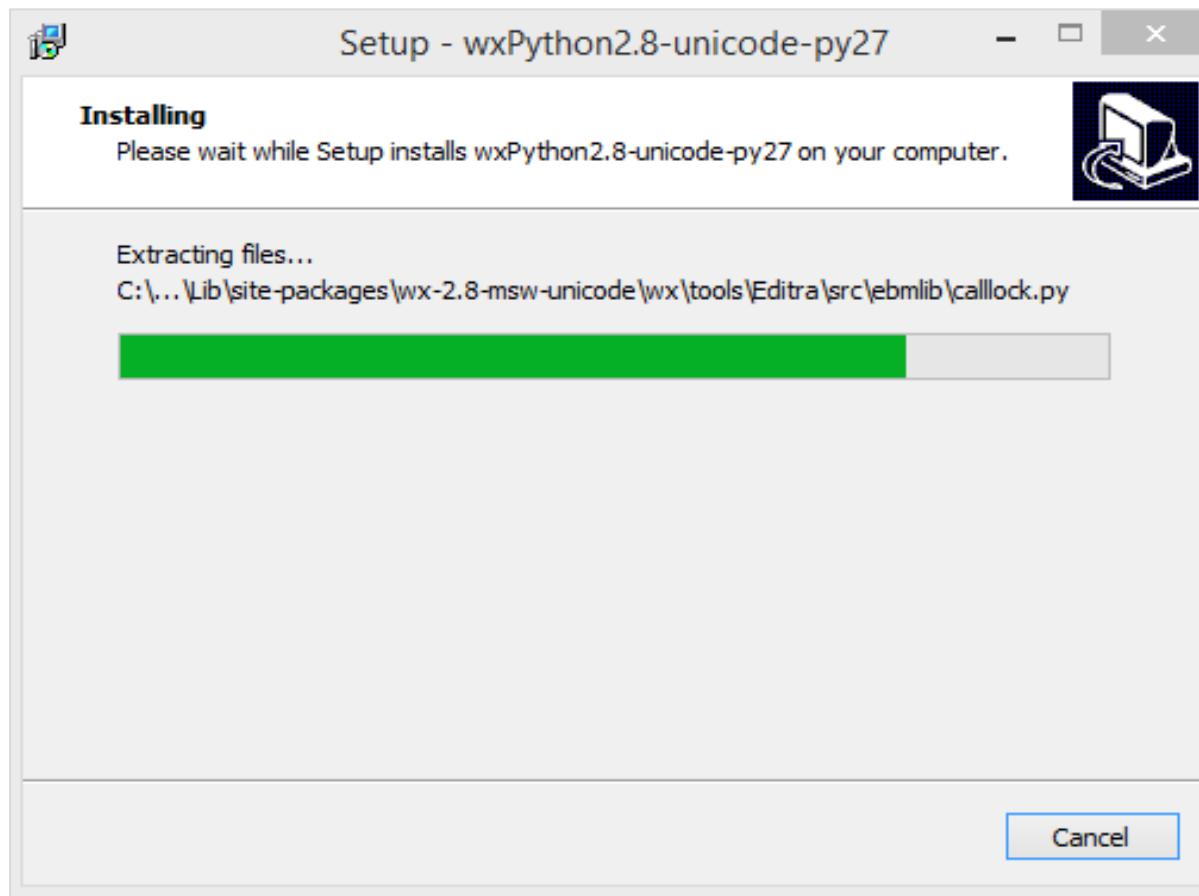

**For windows** to get the required download for wxPython, go to the following URL:

<http://sourceforge.net/projects/wxpython/files/wxPython/2.8.12.1/>

And, download 32 or 64-bit wxpython for windows as per your Windows Operating system.

Name	Modified	Size	Downloads / Week
wxwidgets2.8_2.8.12.1.orig.tar.gz	2011-07-25	32.6 MB	57
wxPython2.8-win64-unicode-2.8.12.1-py27.exe	2011-07-25	11.7 MB	525
wxPython2.8-win64-unicode-2.8.12.1-py26.exe	2011-07-25	11.7 MB	19
wxPython2.8-win64-devel-2.8.12.1-msvc9x64.tar.bz2	2011-07-25	7.2 MB	12
wxPython2.8-win32-unicode-2.8.12.1-py27.exe	2011-07-25	11.4 MB	525
wxPython2.8-w <del>l</del> Click to download wxPython2.8-win32-unicode-2.8.12.1-py27.exe	2011-07-25	11.4 MB	12
wxPython2.8-win32-docs-demos-2.8.12.1.exe	2011-07-25	7.8 MB	1
wxPython2.8-win32-devel-2.8.12.1-msvc9.tar.bz2	2011-07-25	10.8 MB	1
wxPython2.8-win32-ansi-2.8.12.1-py27.exe	2011-07-25	11.3 MB	13
wxPython2.8-win32-ansi-2.8.12.1-py26.exe	2011-07-25	11.3 MB	1
wxPython2.8-osx-unicode-2.8.12.1-universal-py2.7.dmg	2011-07-25	42.1 MB	90

Download the 32-bit wxPython and install the same.

Once the installation is done, it opens the command line and auto runs some commands as shown below:

```
C:\Python27\python.exe
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art
default.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art
internal.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art
msw.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\bar
.py
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\but
tonbar.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\con
trol.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\gal
lery.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\pag
e.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\pan
el.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\t oo
lbar.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\rulerctrl.
py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\shapedbutt
on.py ...
```

wxPython is now installed. This module is required for the RIDE Ide to be used for Robot Framework which is the next step.

**On Linux**, you should be able to install wxPython with your package manager. For example, on Debian based systems such as Ubuntu running sudo apt-get install python-wxgtk2.8 ought to be enough.

**On OS X**, you should use wxPython binaries found from the wxPython download page. wxPython2.8 only has 32 bit build available, so Python must be run in 32-bit mode also. This can be done globally by running:

```
> defaults write com.apple.versioner.python Prefer-32-Bit -bool yes
```

or, just for the RIDE execution:

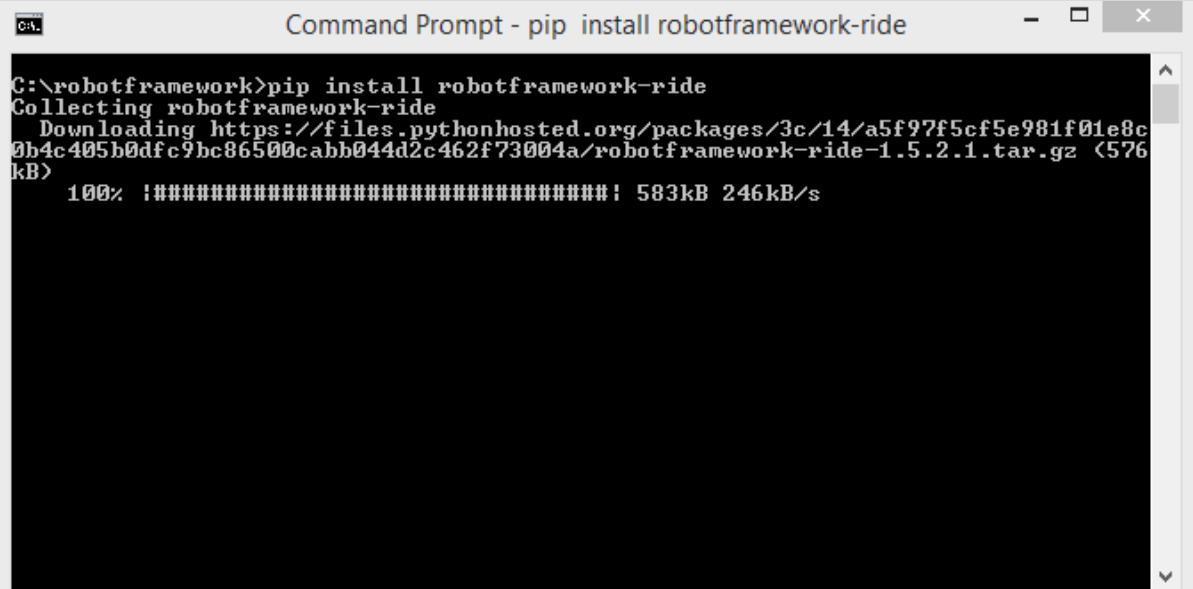

```
> VERSIONER_PYTHON_PREFER_32_BIT=yes ride.py
```

## Install Ride

Ride is Robot Framework IDE. We can use pip to install it as shown below.

### Command

```
pip install robotframework-ride
```

Command Prompt - pip install robotframework-ride

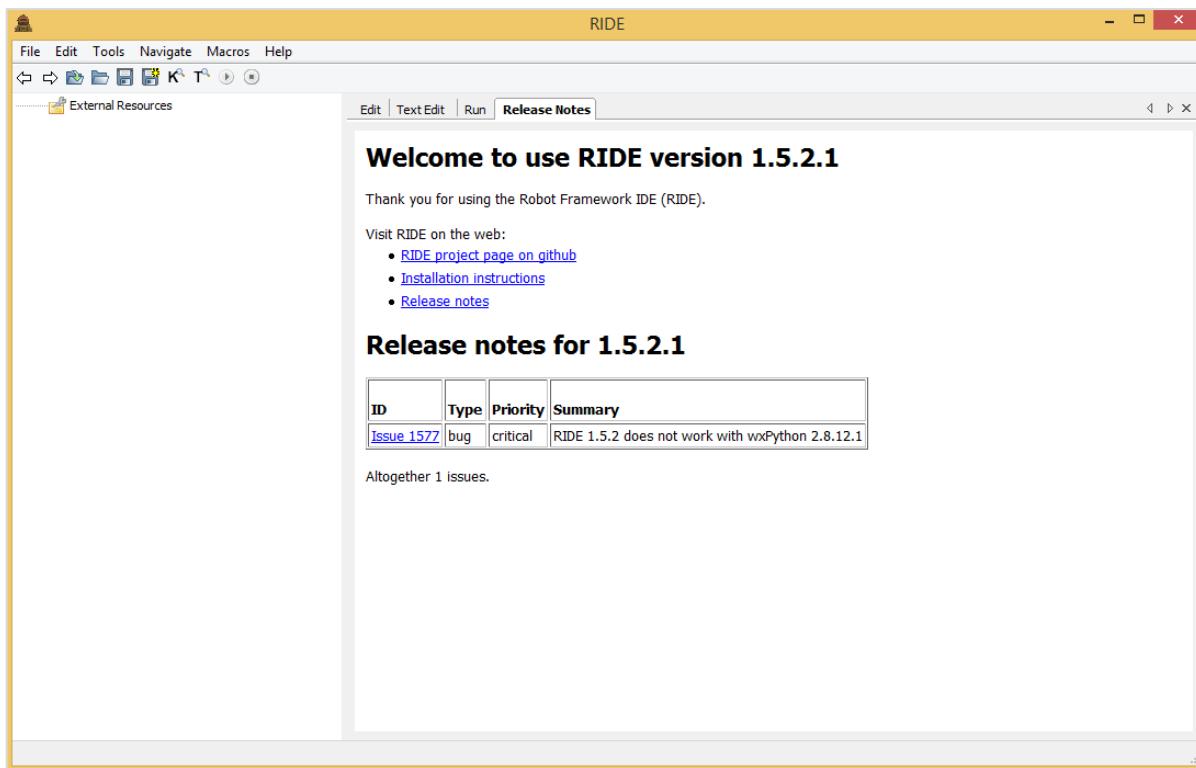

```
C:\robotframework>pip install robotframework-ride
Collecting robotframework-ride
  Downloading https://files.pythonhosted.org/packages/3c/14/a5f97f5cf5e981f01e8c0b4c405b0dfc9bc86500cabbb044d2c462f73004a/robotframework-ride-1.5.2.1.tar.gz (576 kB)
    100% :#####: 583kB 246kB/s
```

Once the installation is done, open the command prompt and type the following command to open the Ride-IDE.

## Command

```
ride.py
```

The above command opens the IDE as follows:

So we are done with the installation of Robot Framework and can get started working with it.

## Conclusion

---

We now know how to install python, pip, robot framework and also get RIDE installed to work with test cases in robot framework.

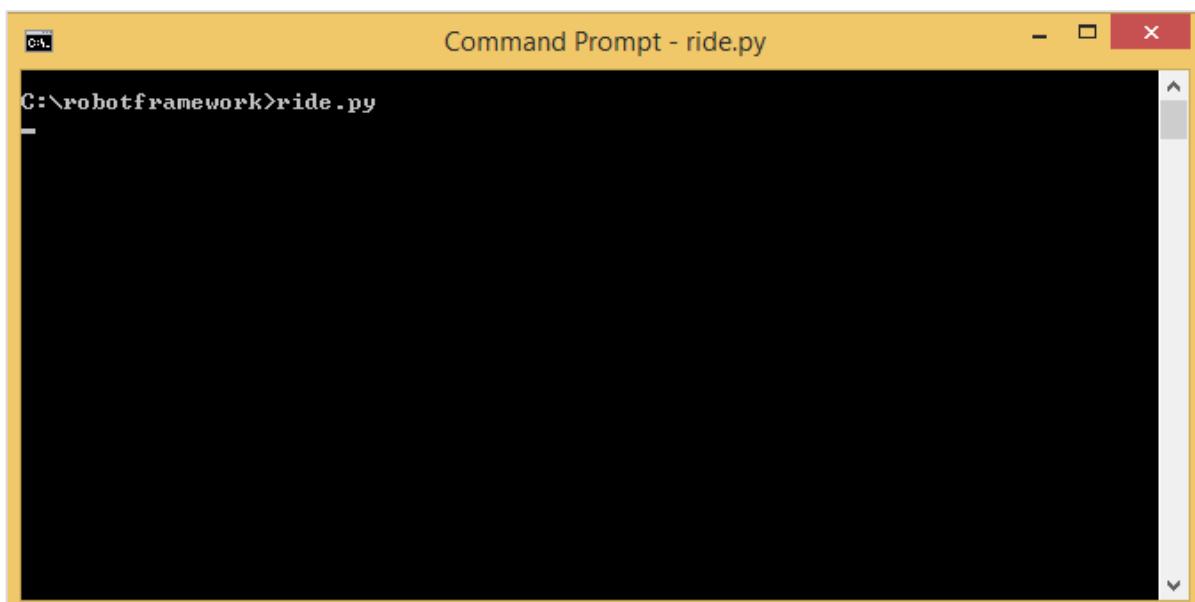

## 4. Robot Framework — Introduction to Ride

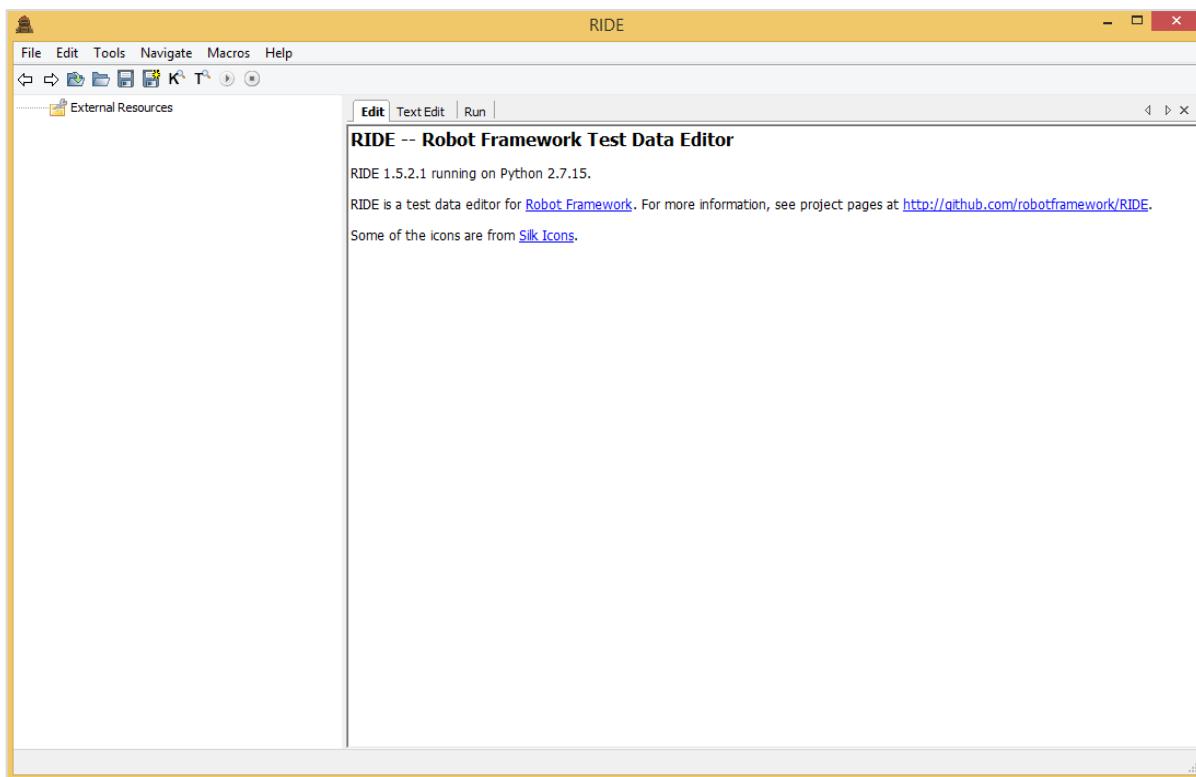

Ride is a testing editor for Robot Framework. Further, we will write test cases in Ride. To start Ride, we need to run the command shown below.

### Command

```
ride.py
```

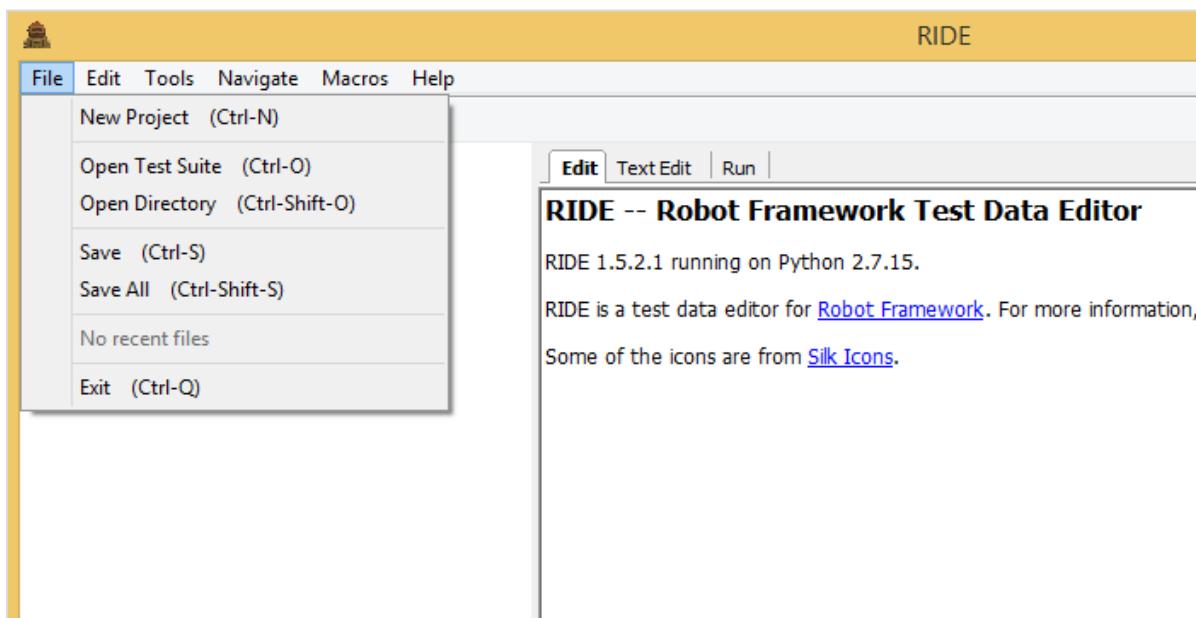

The above command will open the IDE as shown in the following screenshot:

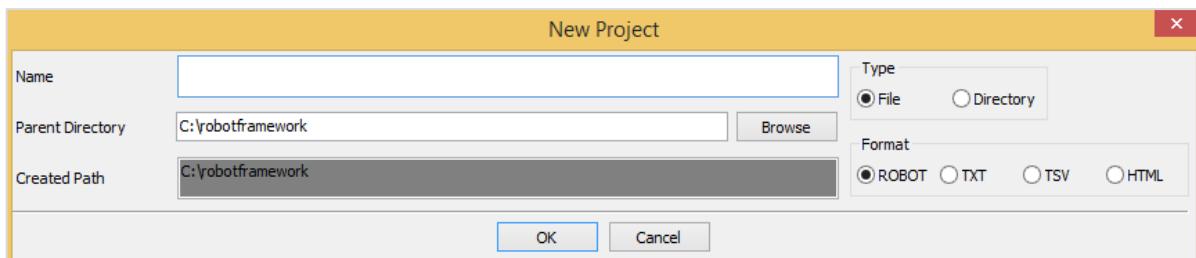

In this chapter, we will walk through the editor to see what options and features are available in the IDE. The options and features will help us in testing our project.

## Create New Project

Go to File and click on New Project as shown below:

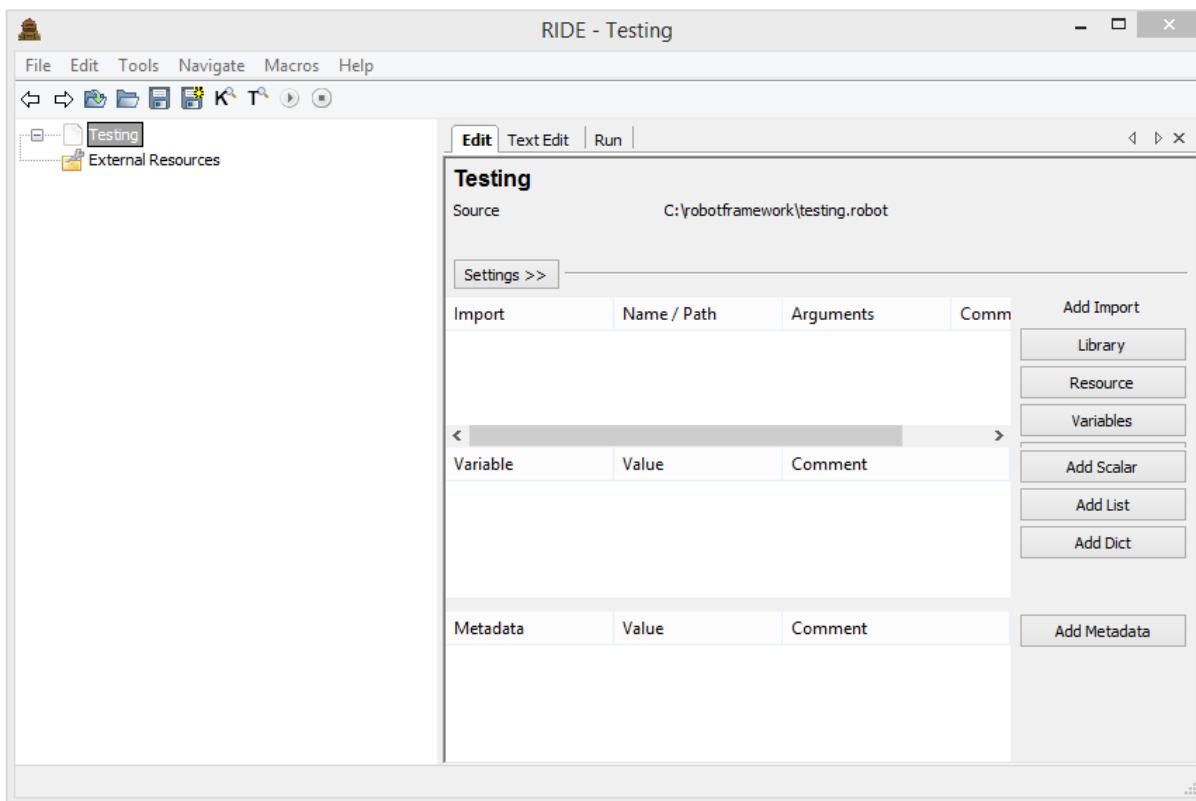

The following screen will appear when you click New Project.

Enter the name of the project. Created Path is the path where the project will get saved. You can change the location if required. The project can be saved as File or directory. You can also save the project in format like ROBOT, TXT, TSV or HTML. In this tutorial, we are going to use the format ROBOT and how to write and execute test-cases.

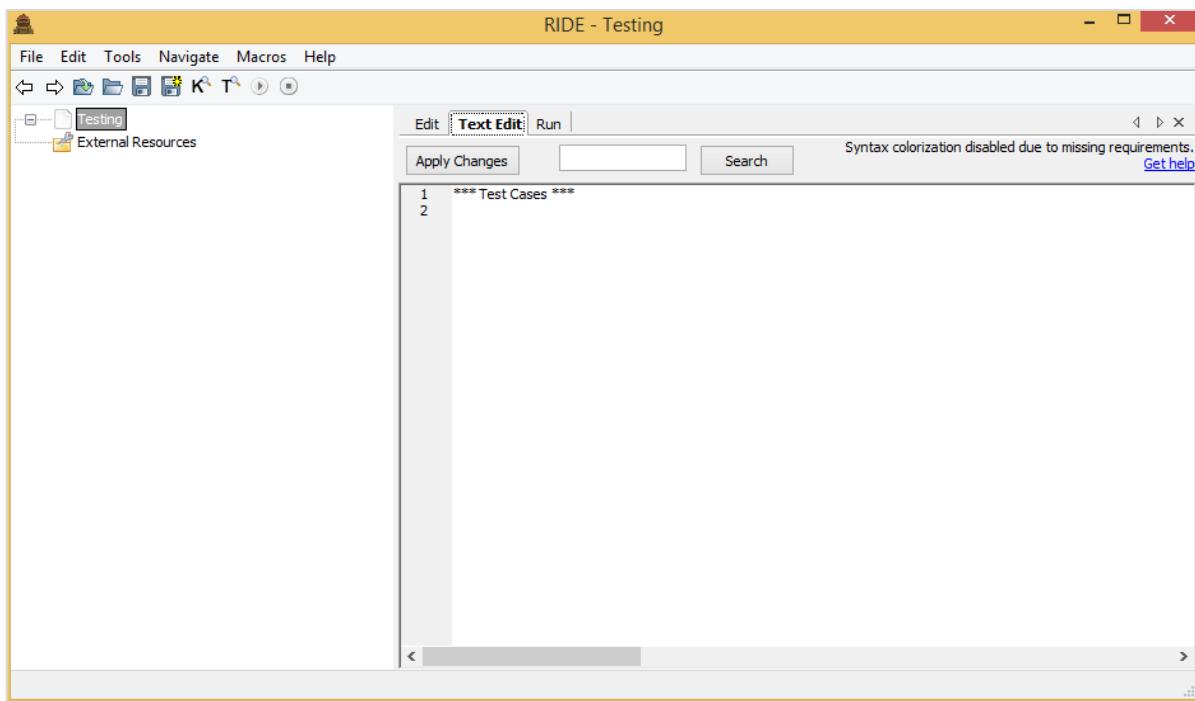

Now, we will add a project as a file the way it is shown below. The project is named Testing and the following screen appears after the project is created.

The name of the project is shown on the left side and on the right side we can see three tabs Edit, TextEdit and Run.

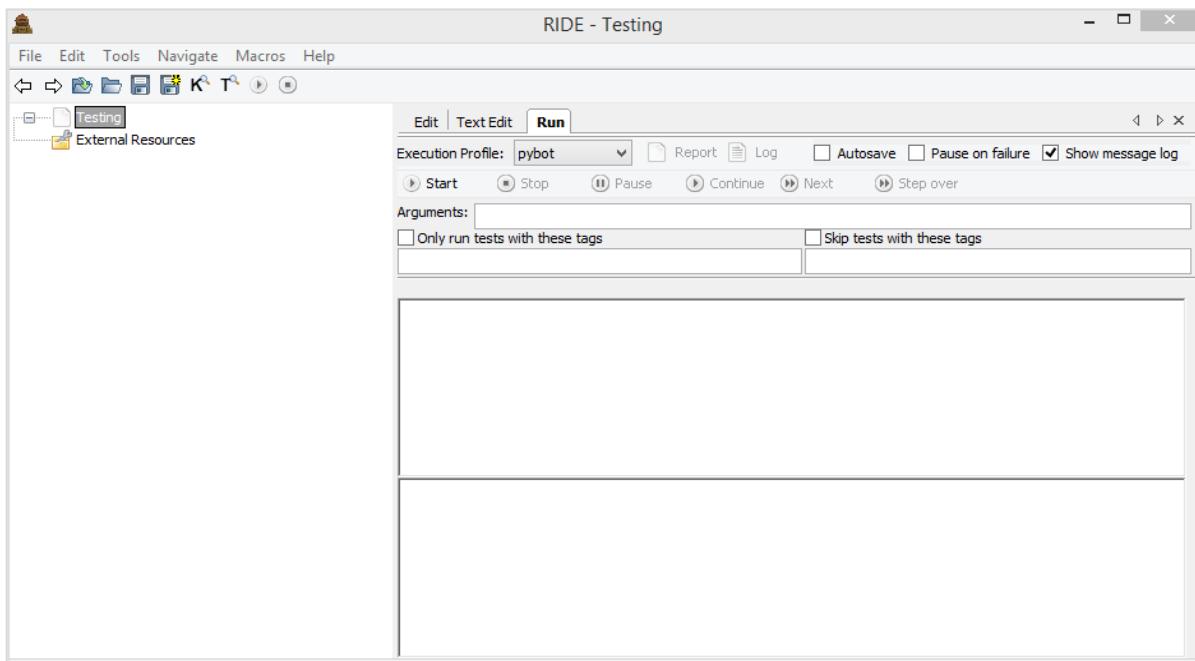

Edit has a lot of options on the UI as shown above. In this section, we can add data required to run our test cases. We can import Library, Resource, Variables, Add scalar, Add list, Add dict and Add Metadata.

The details added in the Edit section will be seen in the next tab, Text Edit. You can write the code here in text edit section.

If there is any change added in Textedit, it will be seen in the Edit section. Therefore, both the tabs Edit and TextEdit are dependent on each other and the changes done will be seen on both.

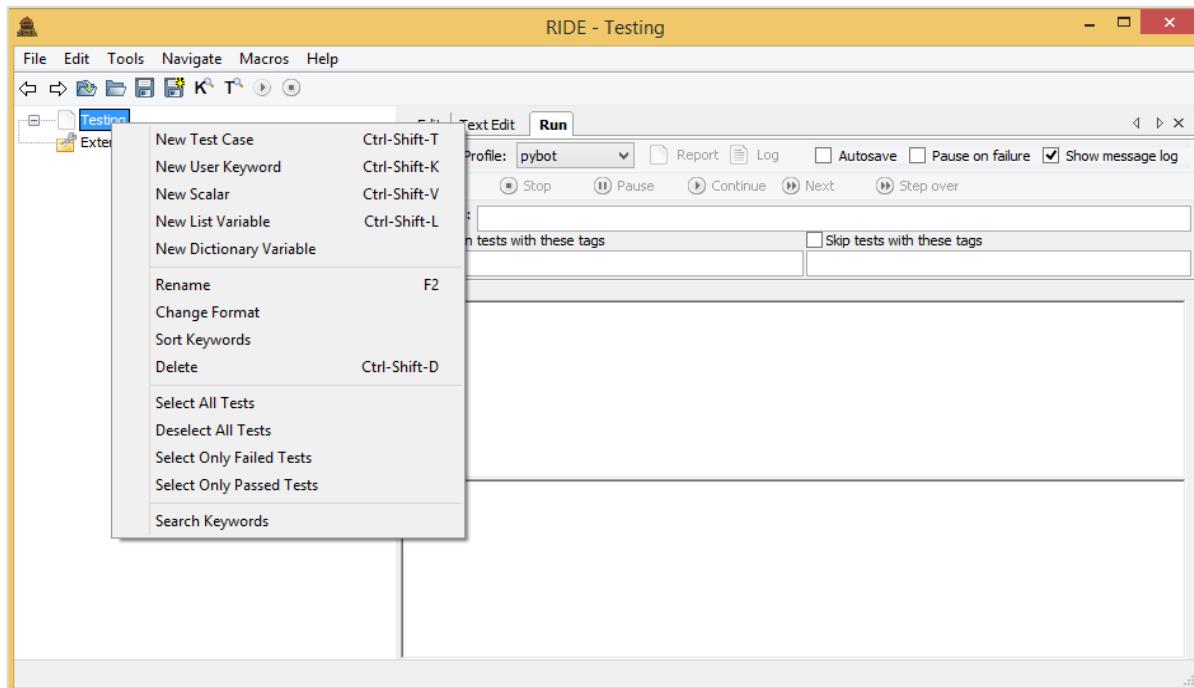

Once the test cases are ready, we can use the third tab Run to execute them.

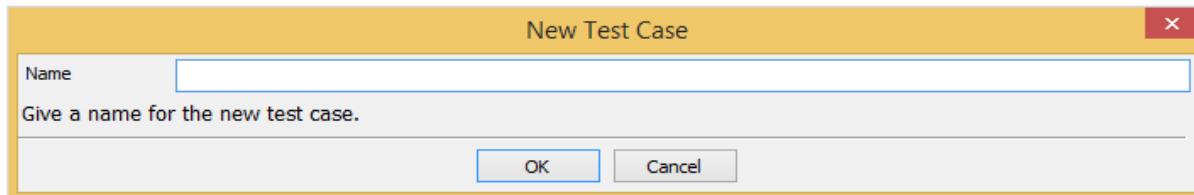

The Run UI is as shown above. It allows to run the test case and comes with options like start, stop, pause continue, next test case, step over, etc. You can also create Report, Log for the test cases you are executing.

To create a test case, we have to do the following:

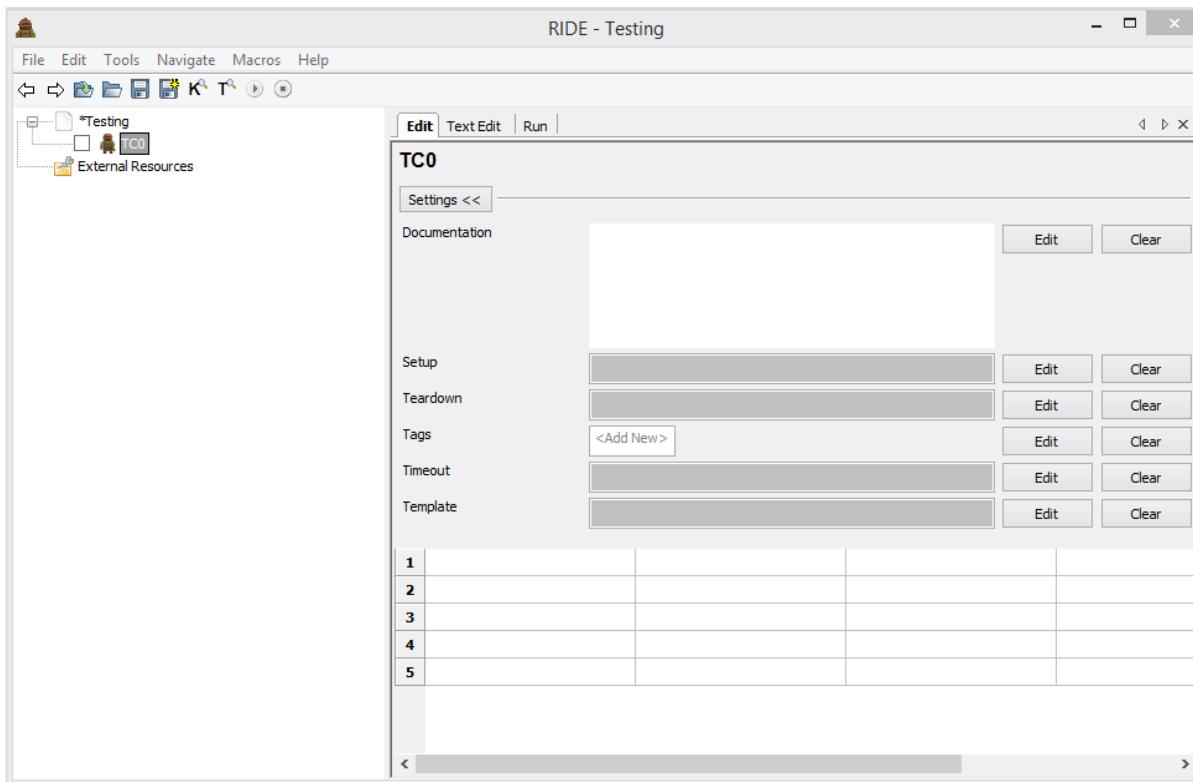

Right-click on the project created and click on new test case as shown below:

Upon clicking New Test Case, a screen appears as shown below:

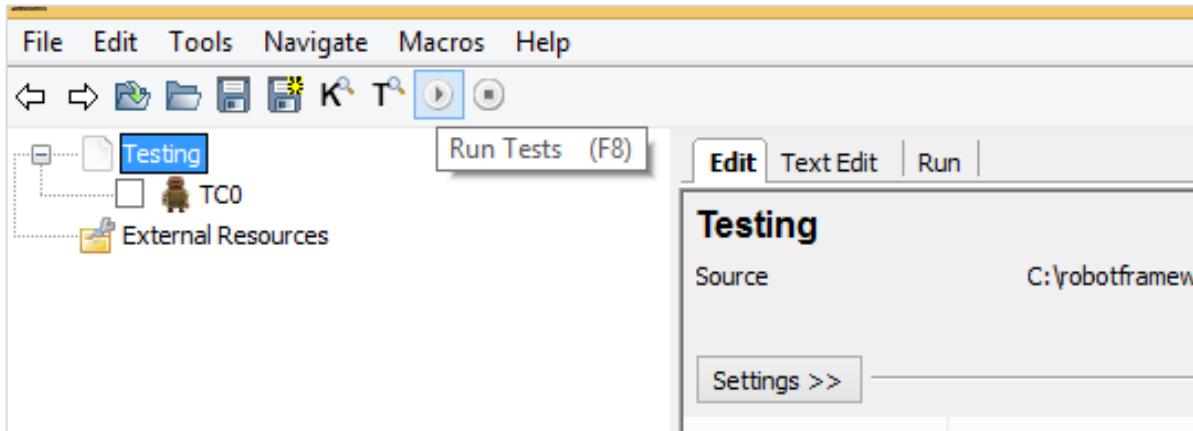

Enter the name of the test case and click *OK*. We have saved the test case as TC0. The following screen appears once the test case is saved.

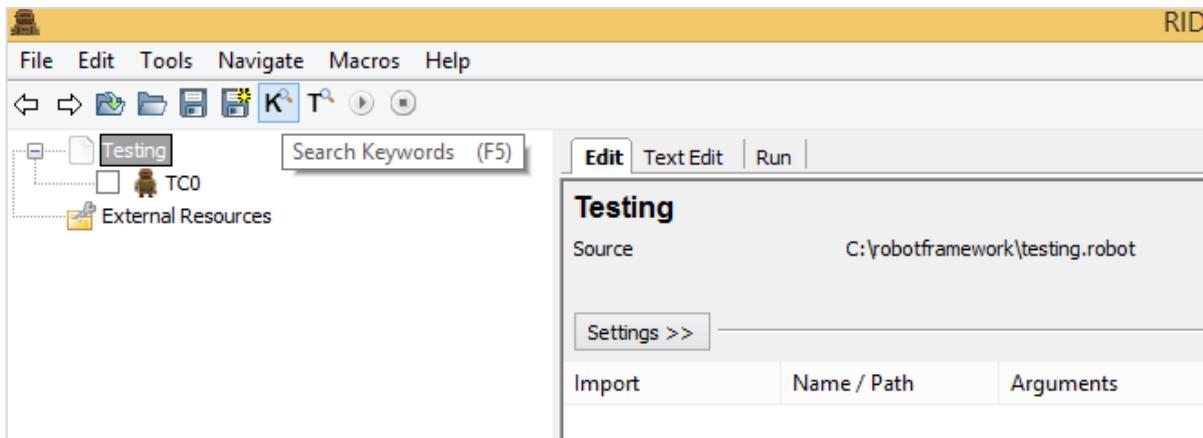

The test case has options like Documentation, setup, teardown, tags, timeout and Template. They have an edit button across it; upon clicking the button a screen appears wherein, you can enter the details for each option. We will discuss the various parameters of these details in our subsequent chapters.

The test cases can be written in tabular format as shown below. Robot framework test cases are keyword based and we can write the test-cases using built-in keywords or keywords imported from the library. We can also create user-defined keywords, variables, etc. in robot framework.

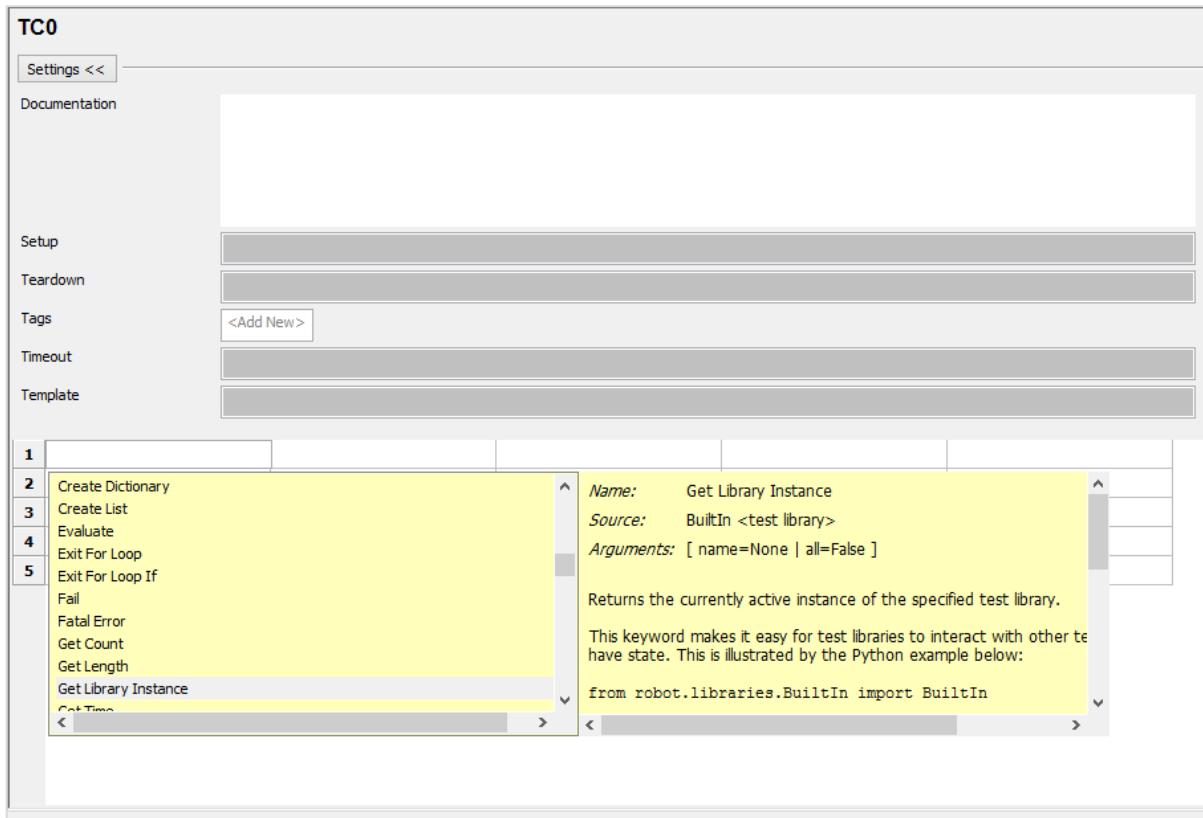

There are shortcuts available in the navigation bar to run/stop test case as shown below:

The search keyword option can be used as shown in the screenshot below:

To get the list of keywords available with robot framework, simple press **ctrl+space** in the tabular format as shown below and it will display all the keywords available:

In case, you cannot remember the keyword, this will help you get the details. We have the details available across each keyword. The details also show how to use the related keyword. In our next chapter, we will learn how to create our first test case in ride.

## Conclusion

In this chapter, we have seen the features available with RIDE. We also learnt how to create test cases and execute them.

# 5. Robot Framework — First Test Case Using Ride

We will explore RIDE and work on our first test case.

Open Ride from command prompt or you can create a shortcut of ride on your desktop.

## From command line

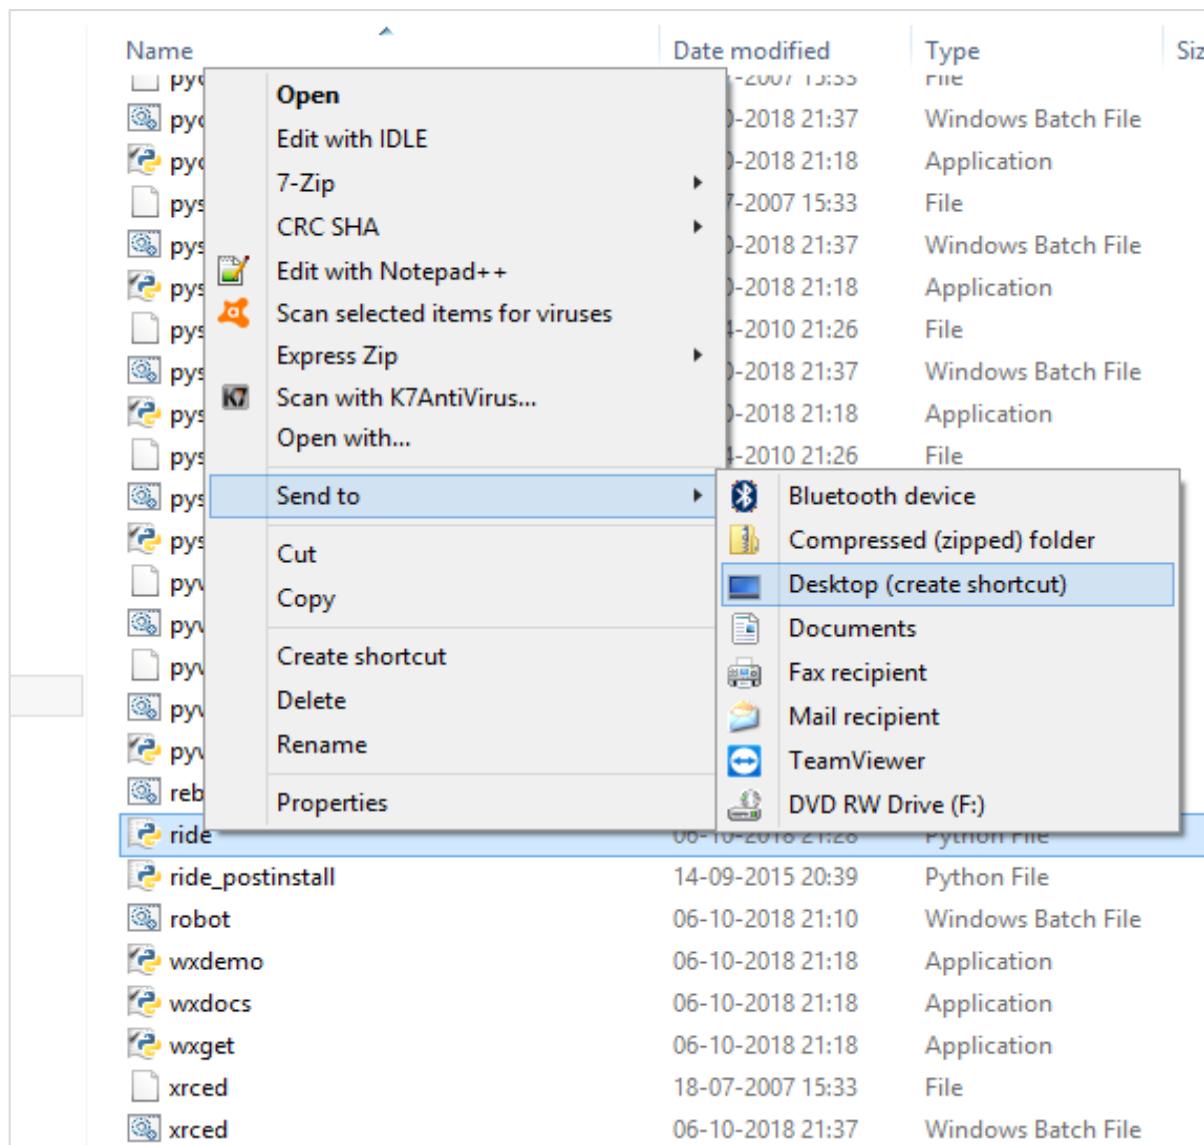

```
ride.py
```

## From Desktop

Go to the path where ride is installed; for windows, it is **C:\Python27\Scripts**.

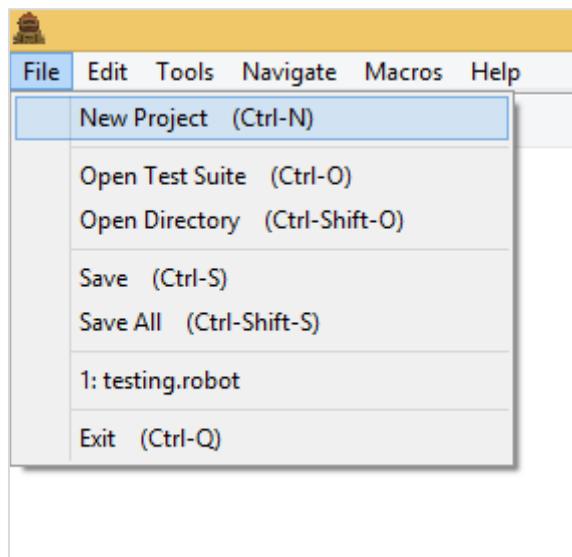

Name	Date modified	Type
pycrust	10-01-2001 15:35	File

robot	06-10-2018 21:10	Windows Batch File
wxdemo	06-10-2018 21:18	Application

Right-click on ride.py and click **Send To -> Desktop** (create shortcut).

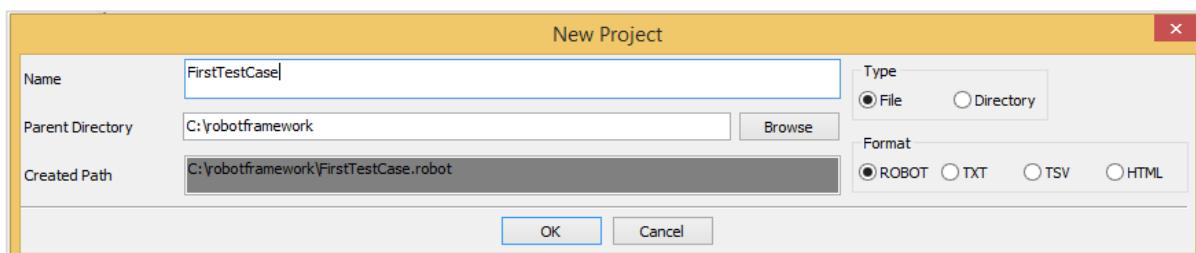

You will now see an icon of ride on your desktop. You can click on it to open the ride editor.

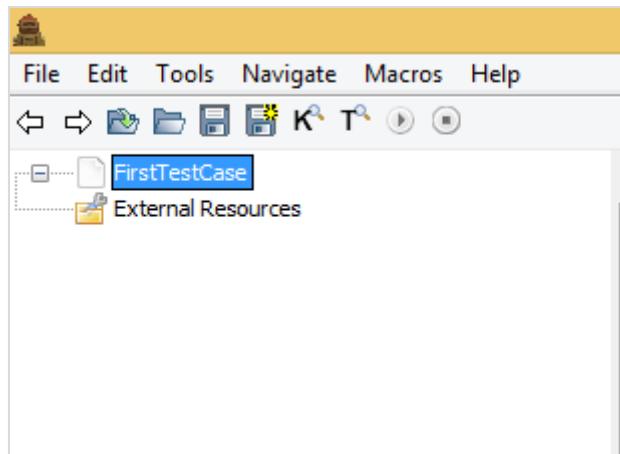

Let us start with our first test case in ride. Open the editor and click on File -> New Project.

Click on *New Project* and enter the name of the project.

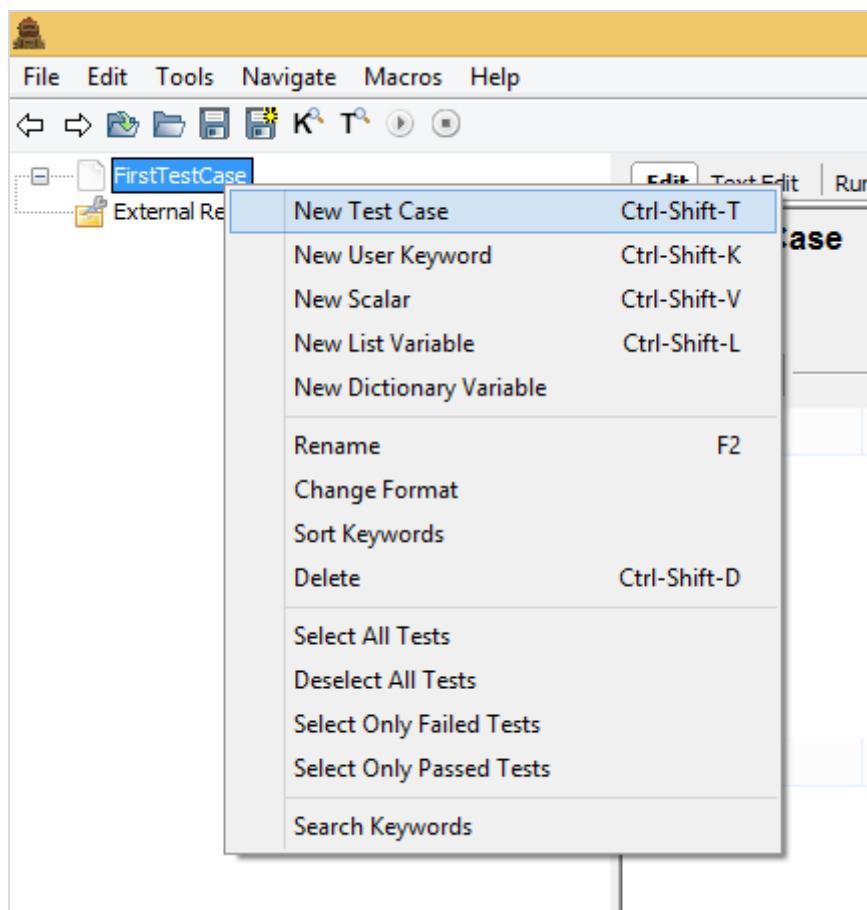

Parent Directory is the path where the project will be saved. You can change the path if required. I have created a folder called robotframework and will save all the files in that folder.

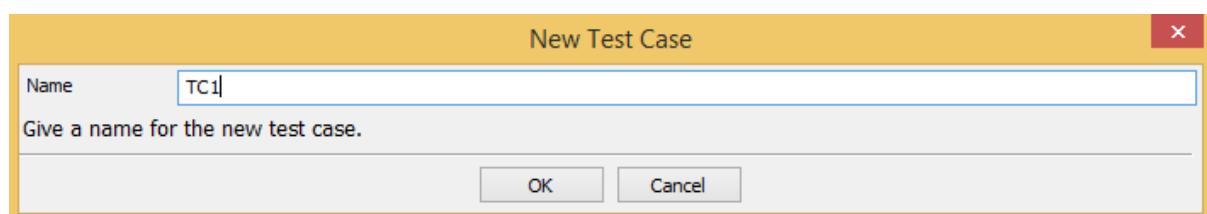

Project *FirstTestCase* is created.

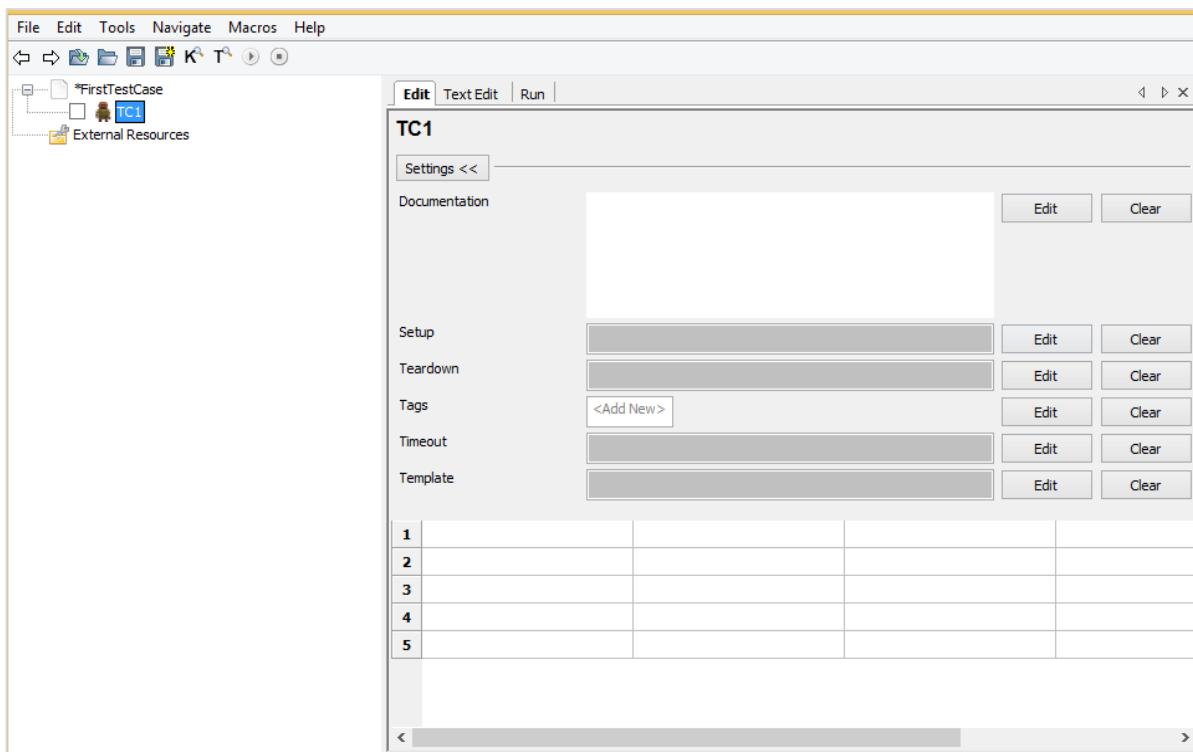

To create test case, right-click on the project.

Click *New Test Case*.

Enter the name of the test case and click OK.

There are 3 tabs shown for the test case created – *Edit*, *Text Edit* and *Run*.

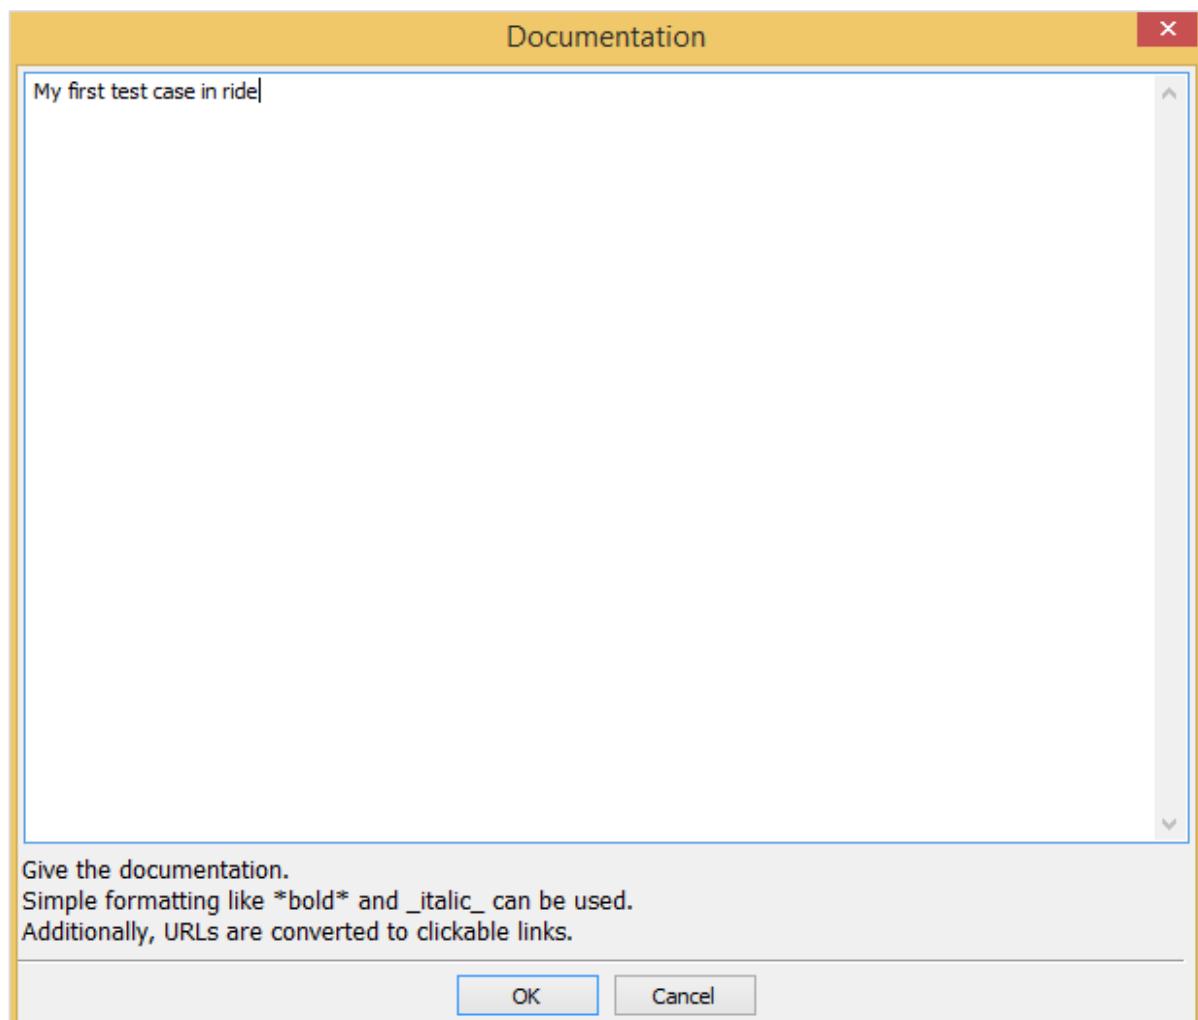

The *Edit* tab comes with two formats – *Settings* and *Tabular*. We will discuss the two formats in our subsequent sections.

## The Settings Format

In Settings, we have documentation, setup, teardown, tags, timeout and template.

### Documentation

You can add details about your test case so that it becomes easy for future reference.

Click OK to save the documentation.

### Setup and Teardown

If there is a setup assigned to a test case, it will be executed before the test case execution and the test setup that will be executed after the test case is done for teardown. We will get into the details of this in our subsequent chapters. We do not need it now for our first test case and can keep it empty.

### Tags

This is used for tagging test cases – to include, exclude specific test cases. You can also specify if any of the test cases is critical.

## Timeout

This is used to set a timeout on the test case. We will keep it empty for now.

## Template

This will have the keywords to be used for the test case. It is mostly used for data driven test case. The high-level user-defined keyword is specified in the template and test cases are used to pass data to the keyword.

In the tabular format, we will write our first test case and execute the same to see the output.

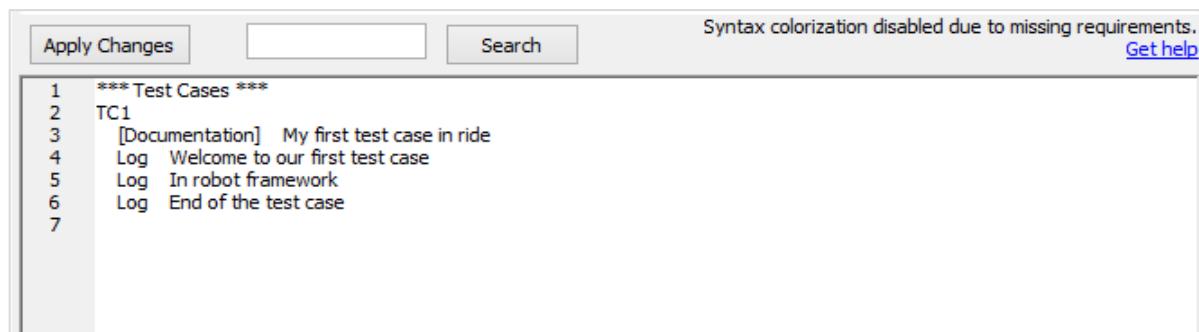

In this test case, we are just going to add some logs and see the output of it. Consider the following screenshot to understand this:

The screenshot shows the Robot Framework Test Case Editor interface. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. Below the tabs, the title 'TC1' is displayed. On the left side, there is a sidebar with sections for 'Documentation' (containing 'My first test case in ride'), 'Setup', 'Teardown', 'Tags' (with a button '

	Log
1	Welcome to our first test case
2	In robot framework
3	End of the test case
4	
5	

We have used the keyword *Log* to log messages as shown above.

Based on the keywords specified in Edit, we can get the code in Text Edit as shown below:

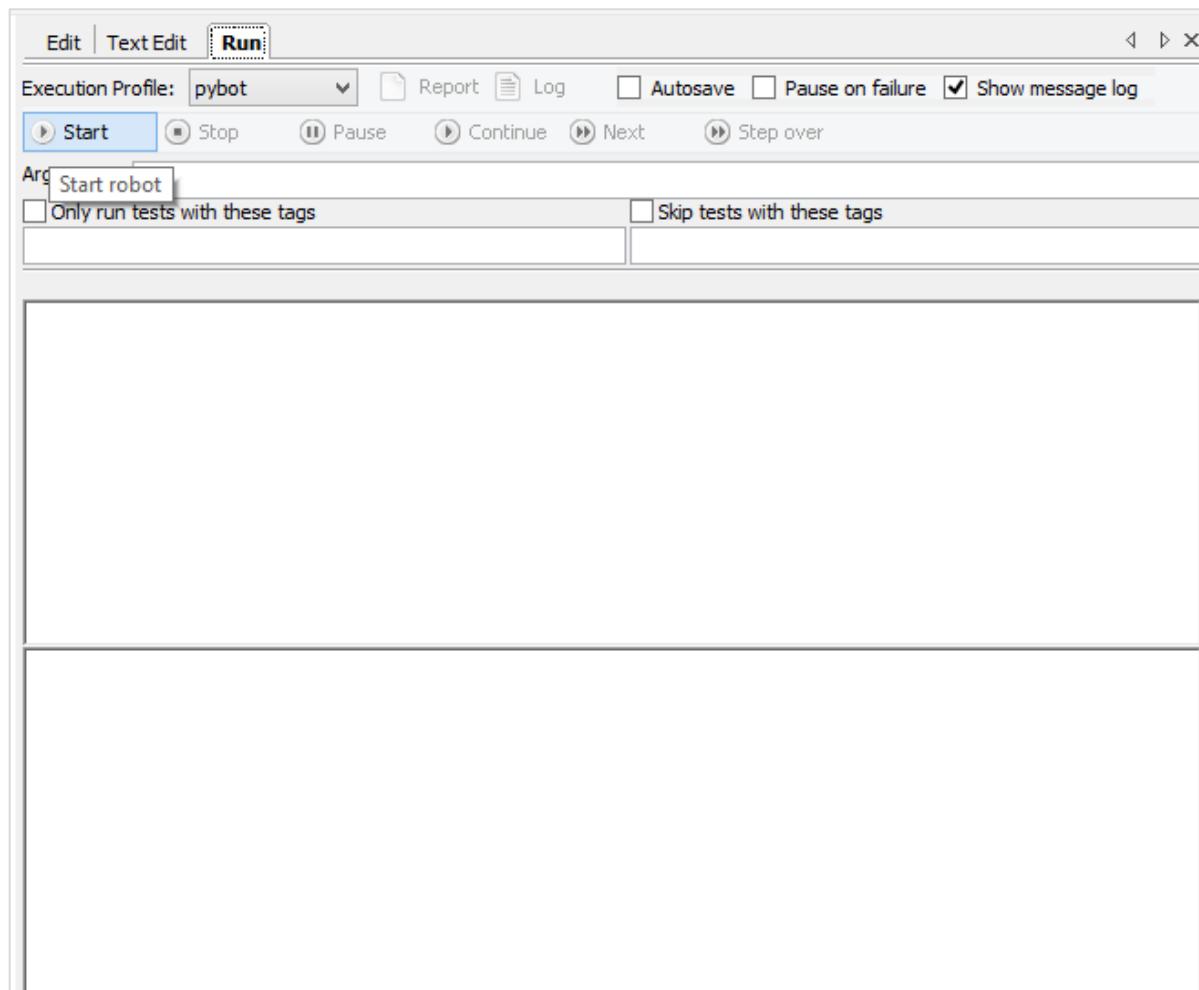

The screenshot shows a text editor window with the following content:

```
1 *** Test Cases ***
2 TC1
3 [Documentation] My first test case in ride
4 Log Welcome to our first test case
5 Log In robot framework
6 Log End of the test case
7
```

At the top of the window, there are buttons for "Apply Changes", "Search", and "Syntax colorization disabled due to missing requirements. Get help".

You may also write the test case in the Text Edit and the same will reflect in the tabular format. Now let us Run the test case and see the output.

To run the test case, we need to click on Start as shown below:

Click on start and here are is the output of the test case:

```

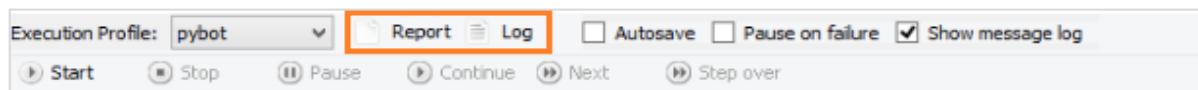

Elapsed time: 0:00:05  pass: 1  fail: 0
FirstTestCase
=====
TC1 :: My first test case in ride | PASS |
FirstTestCase | PASS |
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\local\temp\RIDE1lyphe8.d\output.xml
Log:   c:\users\local\temp\RIDE1lyphe8.d\log.html
Report: c:\users\local\temp\RIDE1lyphe8.d\report.html

test finished 20181008 10:12:15
< >
Starting test: FirstTestCase.TC1
20181008 10:12:14.524 : INFO : Welcome to our first test case
20181008 10:12:14.528 : INFO : In robot framework
20181008 10:12:14.532 : INFO : End of the test case
Ending test: FirstTestCase.TC1

```

Our test case has executed successfully and the details are as shown above. It gives the status as *PASS*.

We can also see the details of the test case execution in *Report* and *Log* as highlighted below.

Click on Report and it opens the details in a new tab as follows:

**FirstTestCase Test Report**

**Summary Information**

Status:	All tests passed
Start Time:	20181008 10:12:14.324
End Time:	20181008 10:12:14.542

	Total	Pass	Fail	Elapsed	Pass / Fail
FirstTestCase	1	1	0	00:00:00	<span style="background-color: green; color: white;">P</span>

### Test Execution Log

- <b>SUITE</b> FirstTestCase	00:00:00.218
Full Name: FirstTestCase	
Source: C:\robotframework\FirstTestCase.robot	
Start / End / Elapsed: 20181008 10:12:14.324 / 20181008 10:12:14.542 / 00:00:00.218	
Status: 1 critical test, 1 passed, 0 failed 1 test total, 1 passed, 0 failed	
- <b>TEST</b> TC1	00:00:00.017
Full Name: FirstTestCase.TC1	
Documentation: My first test case in ride	
Start / End / Elapsed: 20181008 10:12:14.517 / 20181008 10:12:14.534 / 00:00:00.017	
Status: <span style="background-color: green; color: white;">PASS</span> (critical)	
+ <b>KEYWORD</b> BuiltIn.Log Welcome to our first test case	00:00:00.004
+ <b>KEYWORD</b> BuiltIn.Log In robot framework	00:00:00.003
+ <b>KEYWORD</b> BuiltIn.Log End of the test case	00:00:00.002

The Log file gives the details of the test execution and the details of keywords we gave for the test case.

In the report and the log file, we get green color for the status.

Let us now make some changes that will lead to the failure of the test case fail and see the output.

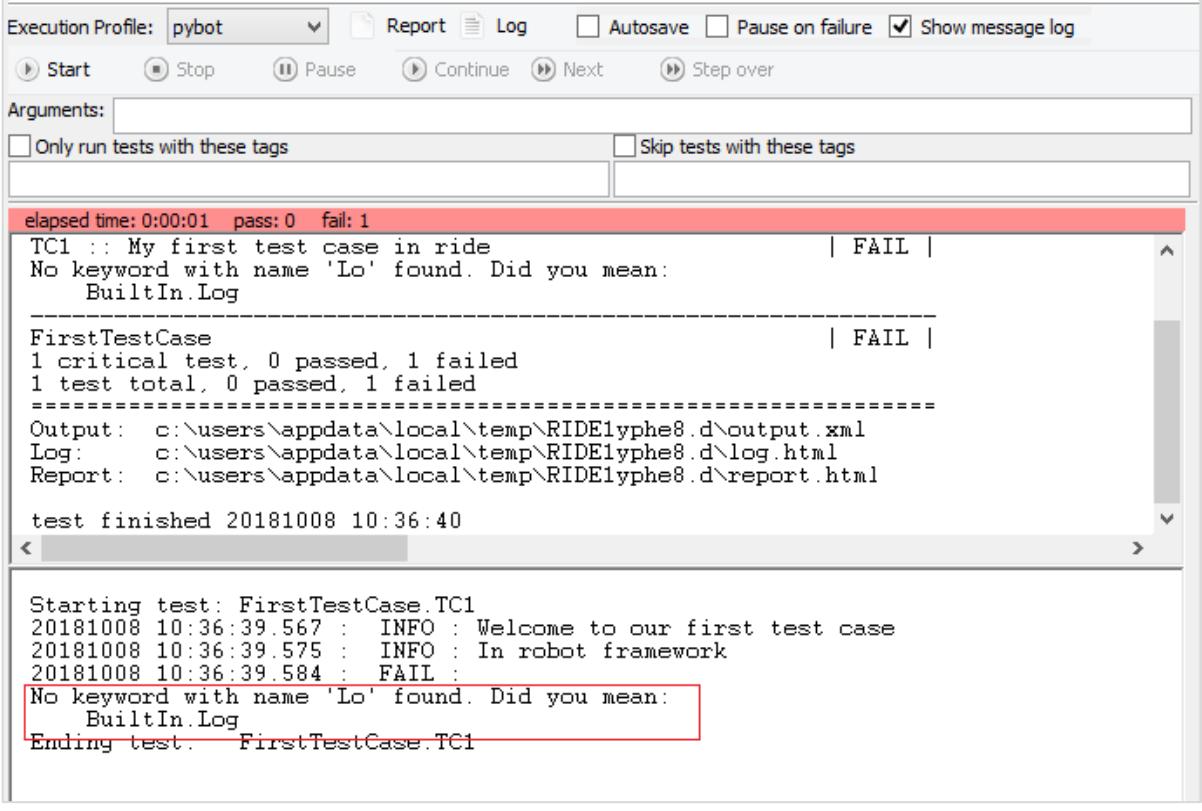

**TC1**

Settings <<

Documentation	My first test case in ride	Edit	Clear
Setup		Edit	Clear
Teardown		Edit	Clear
Tags	<Add New>	Edit	Clear
Timeout		Edit	Clear
Template		Edit	Clear

1	<a href="#">Log</a>	Welcome to our first test case	
2	<a href="#">Log</a>	In robot framework	
3	<a href="#">Lo</a>	End of the test case	
4			
5			
6			
7			
8			

In the above test case, the Log keyword is wrong. We will run the test case and see the output:

The screenshot shows the Robot Framework IDE interface. The top menu bar includes 'Execution Profile: pybot', 'Report', 'Log', 'Autosave' (unchecked), 'Pause on failure' (unchecked), and 'Show message log' (checked). Below the menu are buttons for 'Start', 'Stop', 'Pause', 'Continue', 'Next', and 'Step over'. The 'Arguments:' field is empty. There are two checkboxes: 'Only run tests with these tags' and 'Skip tests with these tags', both unchecked.

The main window displays the test results. A red header bar at the top shows 'elapsed time: 0:00:01 pass: 0 fail: 1'. The test case 'TC1 :: My first test case in ride' has failed, indicated by '| FAIL |' to its right. The error message is: 'No keyword with name 'Lo' found. Did you mean: BuiltIn.Log'. Below this, the test summary shows 'FirstTestCase' failed with '1 critical test, 0 passed, 1 failed' and '1 test total, 0 passed, 1 failed'. The output paths are listed as 'Output: c:\users\appdata\local\temp\RIDE1lyphe8.d\output.xml', 'Log: c:\users\appdata\local\temp\RIDE1lyphe8.d\log.html', and 'Report: c:\users\appdata\local\temp\RIDE1lyphe8.d\report.html'. The test finished at 'test finished 20181008 10:36:40'.

The bottom section shows the log messages for the test run. It starts with 'Starting test: FirstTestCase.TC1', followed by three INFO messages: '20181008 10:36:39.567 : INFO : Welcome to our first test case', '20181008 10:36:39.575 : INFO : In robot framework', and '20181008 10:36:39.584 : FAIL :'. The error message 'No keyword with name 'Lo' found. Did you mean: BuiltIn.Log' is highlighted with a red box. The test ends with 'Ending test: FirstTestCase.TC1'.

We see that the test case has failed. I have highlighted the error that it tells about the test case.

Now will see the report and log output.From Report:

10:36:39.584 <b>FAIL</b> No keyword with name 'Lo' found. Did you mean: Builtin.Log	

When the test case fails, the color is changed to Red as shown above.

## Conclusion

In this chapter, we covered a simple test case and the results seen during execution are shown. The reports and logs show the details of test case execution.

# 6. Robot framework — Writing and Executing Test Cases

In this chapter, we will learn how to write and execute test cases. We would cover the following areas in this chapter:

- Project Setup
- Importing Libraries
- Write test case in tabular format
- Using Tags for Executing Test Case
- Use Resource Files for Test Case

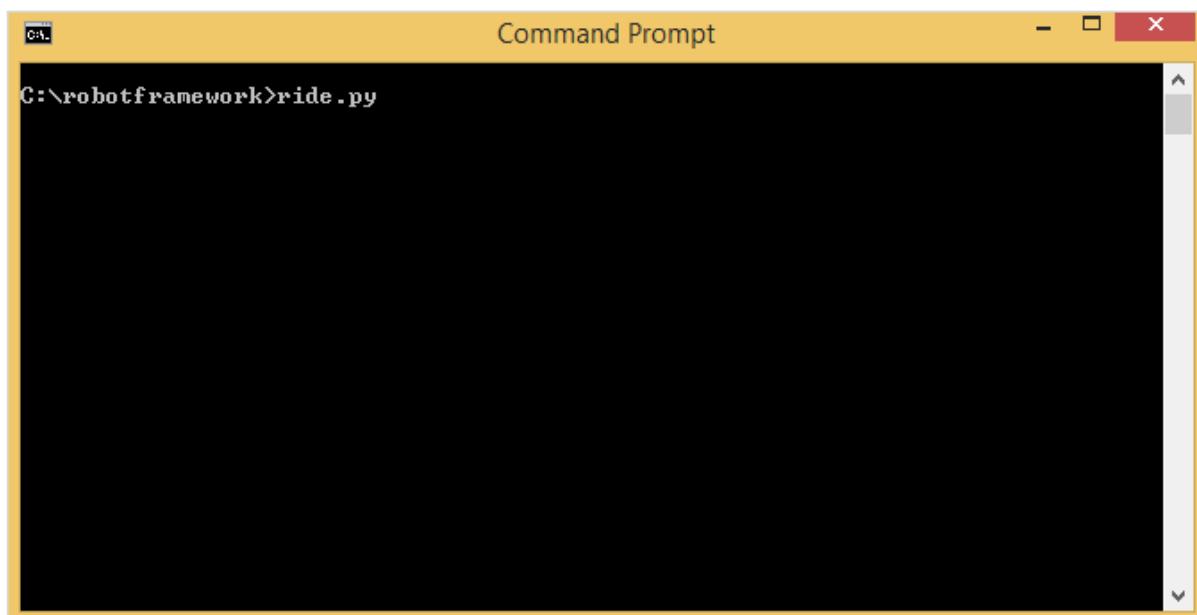

## Project Setup

---

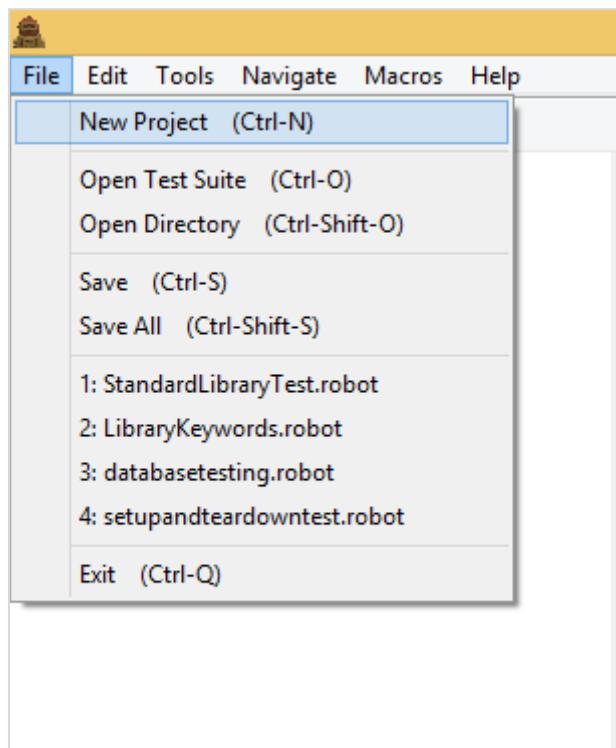

Run the command ride.py to start RIDE IDE.

### Command

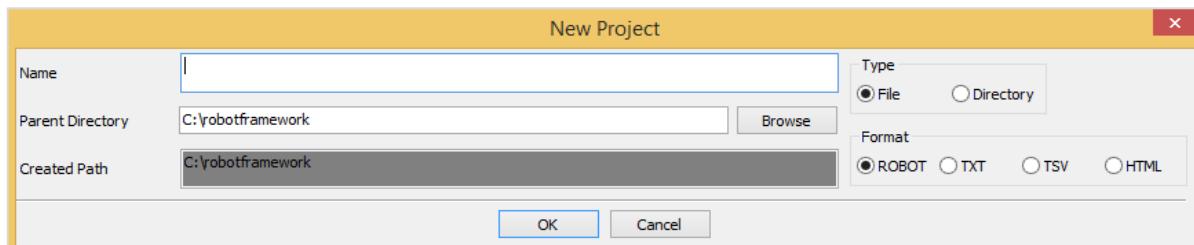

```
ride.py
```

Click on **File -> New Project** as shown below:

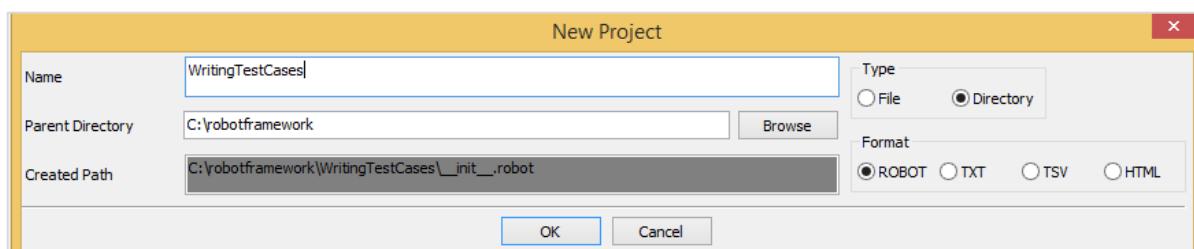

Upon clicking New Project, the screen will appear as shown below:

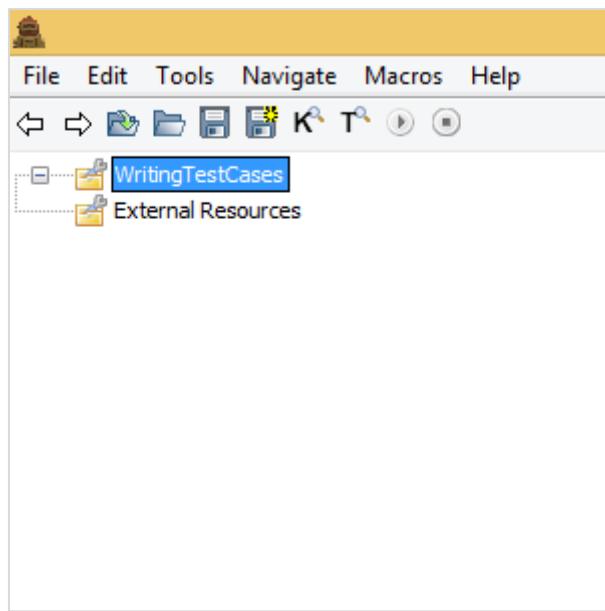

New Project shows the type as file or directory. By default, File is selected. We will click on Directory to create test suite, which can have many test suites in that directory. Each suite will have test-cases.

We will use the ROBOT format for now.

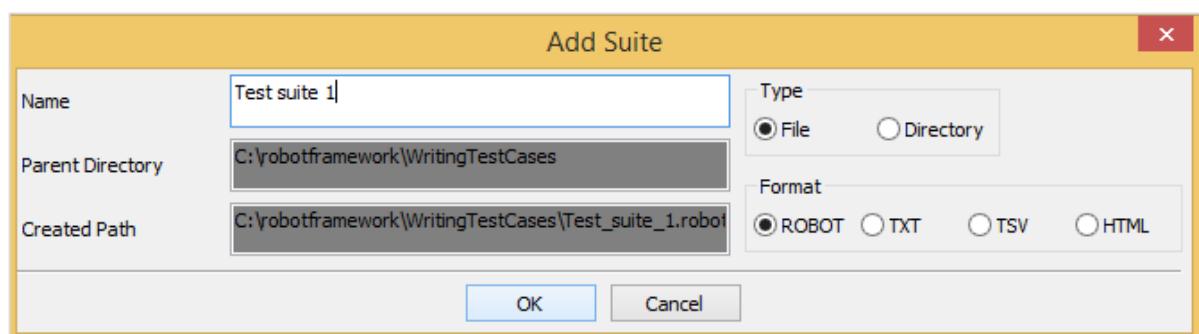

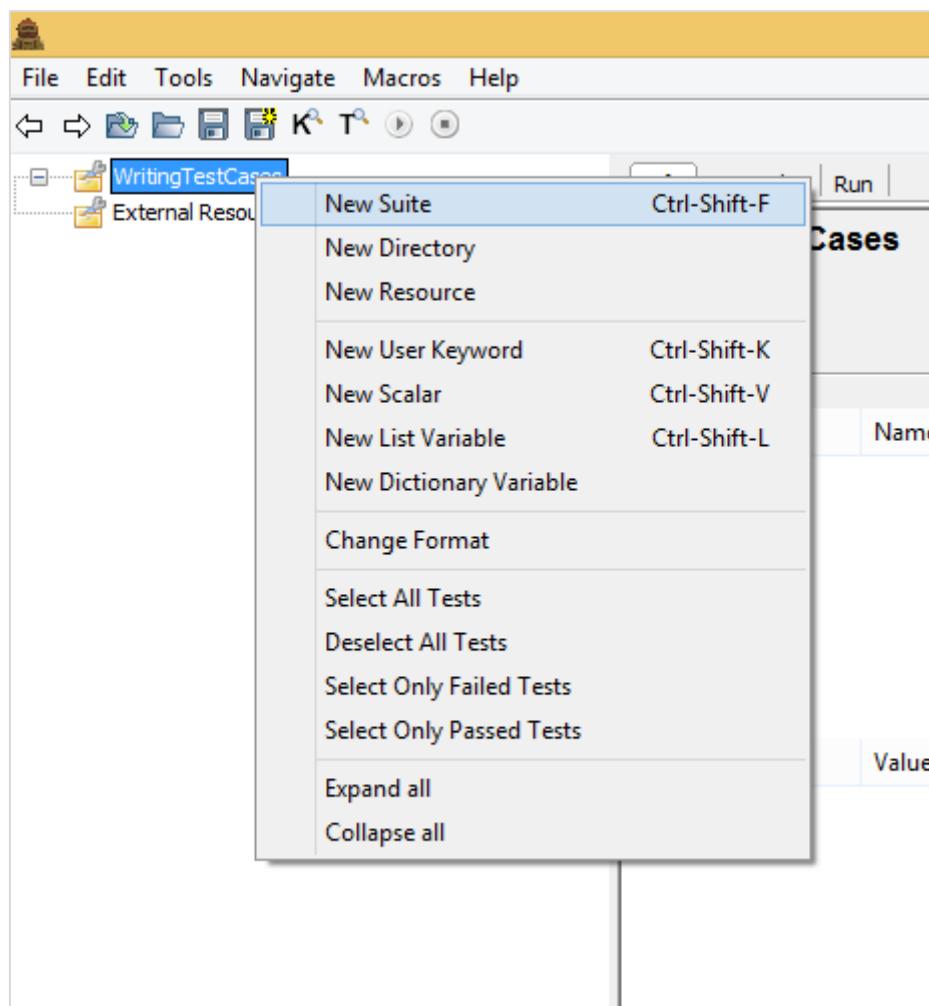

The Parent-Directory is the path where the *WritingTestCases* directory will be created. Click OK to save the test suite directory.

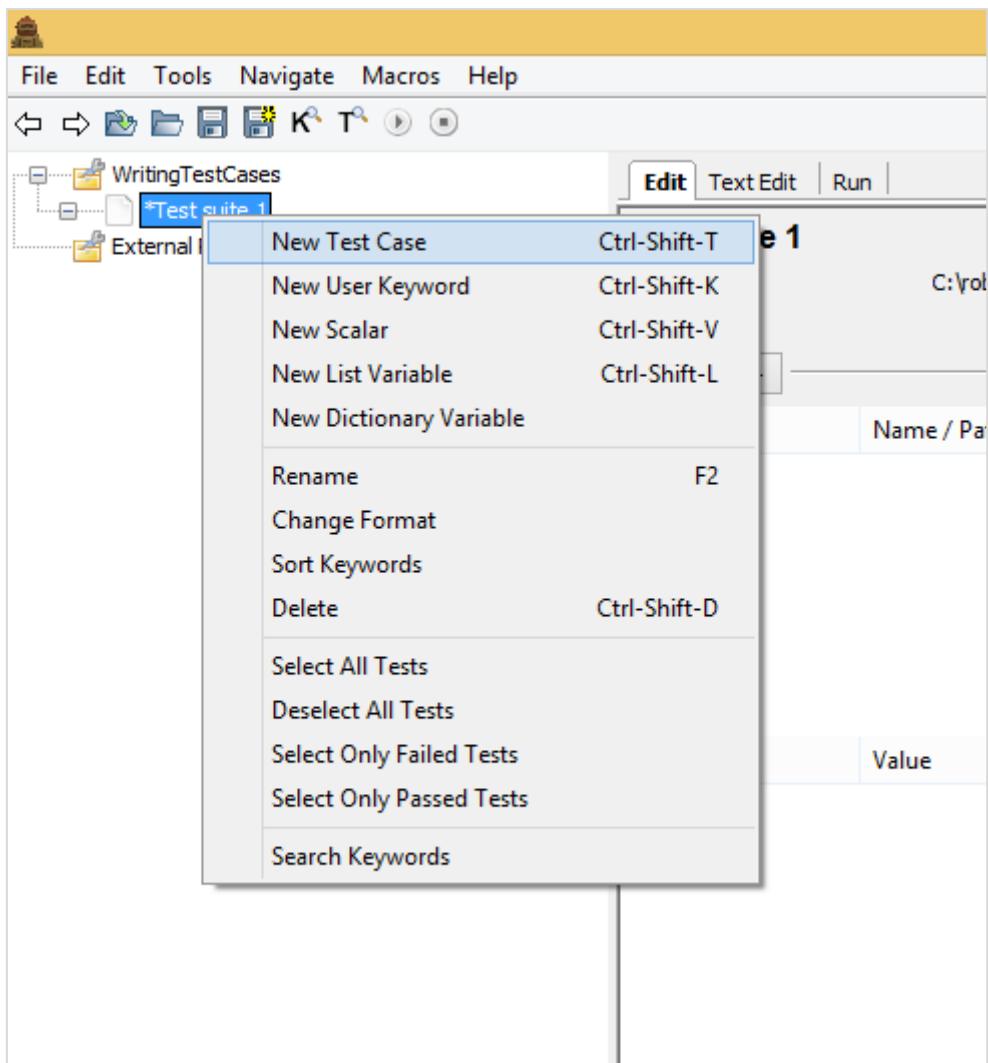

Right-click on the directory created and click on *New Suite*. You can also create sub directories with test suites in that.

For now, we will start with Test Suite creation as shown below:

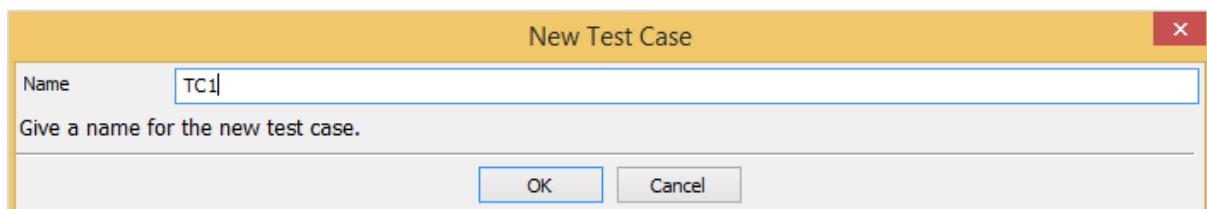

Click OK to save the Test suite.

Now you can add test case to the suite. Right-click on the Test suite created as shown below:

Click *New Test Case*. It will display the screen to add name of the test case as shown below:

Click OK to save the test case. We have the project setup ready.

## Importing Libraries

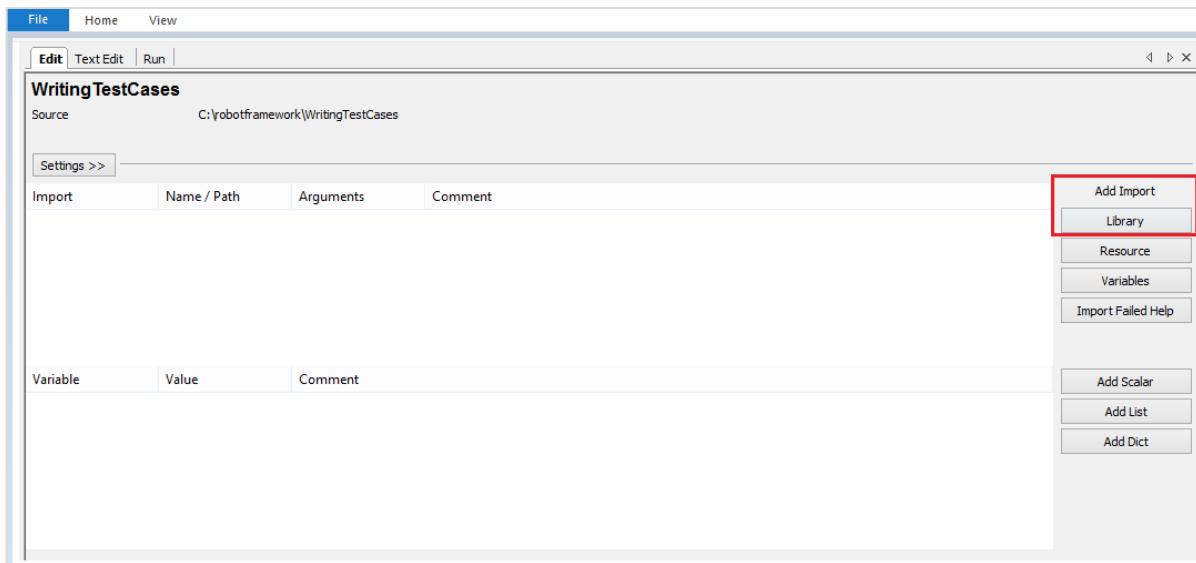

Robot Framework has its own built-in library, which need not be imported. But we need to interact with the browsers, databases, etc. To interact, we need to import the libraries.

The list of external libraries supported by robot framework are listed on robot framework official site as shown below:

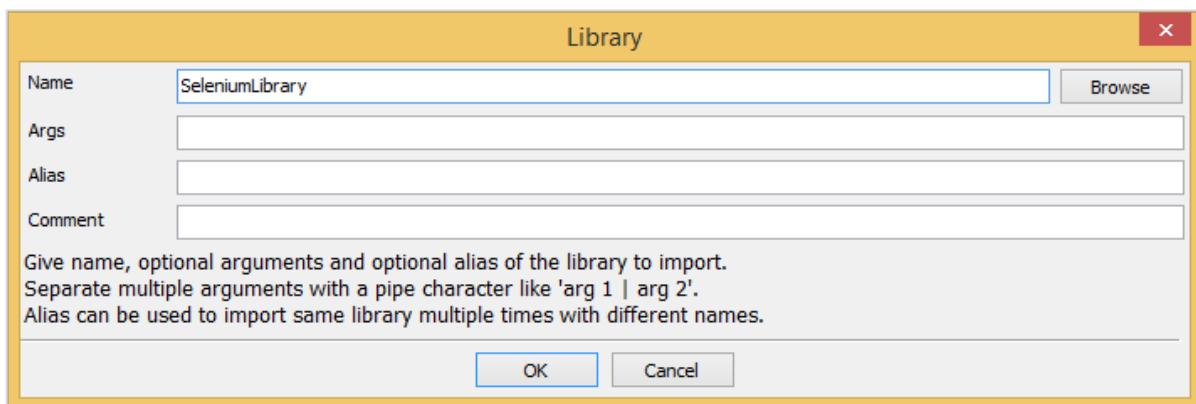

<a href="#">Android library</a>	<a href="#">AnywhereLibrary</a>	<a href="#">AppiumLibrary</a>
Library for all your Android automation needs. It uses Calabash Android internally.	Library for testing Single-Page Apps (SPA). Uses Selenium Webdriver and Appium internally.	Library for Android- and iOS-testing. It uses Appium internally.
<a href="#">Archive library</a>	<a href="#">AutoItLibrary</a>	<a href="#">CncLibrary</a>
Library for handling zip- and tar-archives.	Windows GUI testing library that uses AutoIt freeware tool as a driver.	Library for driving a CNC milling machine.
<a href="#">Database Library (Java)</a>	<a href="#">Database Library (Python)</a>	<a href="#">Debug Library</a>
Java-based library for database testing. Usable with Jython. Available also at <a href="#">Maven central</a> .	Python based library for database testing. Works with any Python interpreter, including Jython.	A debug library for RobotFramework, which can be used as an interactive shell(REPL) also.
<a href="#">Diff Library</a>	<a href="#">Django Library</a>	<a href="#">Eclipse Library</a>
Library to diff two files together.	Library for <a href="#">Django</a> , a Python web framework.	Library for testing Eclipse RCP applications using SWT widgets.
<a href="#">robotframework-faker</a>	<a href="#">FTP library</a>	<a href="#">HTTP library (livetest)</a>
Library for <a href="#">Faker</a> , a fake test data generator.	Library for testing and using FTP server with Robot Framework.	Library for HTTP level testing using livetest tool internally.
<a href="#">HTTP library (Requests)</a>	<a href="#">HttpRequestLibrary (Java)</a>	<a href="#">iOS library</a>
Library for HTTP level testing using Request internally.	Library for HTTP level testing using Apache HTTP client. Available also at <a href="#">Maven central</a> .	Library for all your iOS automation needs. It uses Calabash iOS Server internally.
<a href="#">ImageHorizonLibrary</a>	<a href="#">JavaFXLibrary</a>	<a href="#">MongoDB library</a>
Cross-platform pure Python library for GUI	Library for testing JavaFX applications based	Library for interacting with MongoDB using

For working with browsers and web application, we are going to import Selenium Library. The installation is discussed in the chapter **Working with Browsers using Selenium Library.**

To import a library, we need to click main project. To the right, the setting will display the Add Import option as shown below:

Click Library and enter the name of the library as shown below:

Click Ok to save the library.

The settings will be displayed in the settings as shown below:

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

We need to repeat the same step and add library for the test suite created. Click on the test suite created and import the library as shown below:

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

When you click on the test case on the left side, it will display the tabular format where you can enter the keywords. Now, you can use the built-in keywords and the keywords available from the selenium library.

## Write test case in tabular format

Here is a simple test case, which opens the URL in chrome browser.

The screenshot shows a software interface for creating a test case named 'TC1'. At the top, there are buttons for 'Edit', 'Text Edit', and 'Run'. Below the title 'TC1' are sections for 'Documentation', 'Setup', 'Teardown', 'Tags' (with a button to add new), 'Timeout', and 'Template'. Under 'Setup', there is a table with one row containing a URL and a browser type. The table has columns for step number, action, and parameters. The first three rows are filled with actions: 'Open Browser' (URL: https://www.tutorialspoint.com/, browser: chrome), 'Maximize Browser Window', and 'Close Browser'. The remaining four rows are empty. To the right of the table are 'Edit' and 'Clear' buttons for each row.

1	Open Browser	https://www.tutorialspoint.com/	chrome			
2	Maximize Browser Window					
3	Close Browser					
4						
5						
6						
7						

The following shows the details of the test cases:

```
*** Settings ***
Library      SeleniumLibrary

*** Test Cases ***
TC1
    Open Browser    https://www.tutorialspoint.com/    chrome
    Maximize Browser Window
    Close Browser
```

We will add one more test case: TC2 in the same project.

1	`\${a}`	Set Variable	Hi				
2	Log		`\${a}`				
3	`\${b}`	Set Variable If	`\${number}>0	Yes	No		
4	Log		`\${b}`				
5							

```
*** Settings ***
Library           SeleniumLibrary

*** Variables ***
${number}          100

*** Test Cases ***
TC1
    Open Browser      https://www.tutorialspoint.com/      chrome
    Maximize Browser Window
    Close Browser

TC2
    ${a}    Set Variable    Hi
    Log    ${a}
    ${b}    Set Variable If    ${number}>0    Yes    No
    Log    ${b}
```

We can add multiple test cases under the test suite created. Click Run to execute the test cases. The execution will take place based on the number of test cases added:

The screenshot shows the Robot Framework Test Runner interface. The 'Run' tab is selected. In the Arguments section, there are two checkboxes: 'Only run tests with these tags' and 'Skip tests with these tags'. Below this, the command line output shows the execution of test cases:

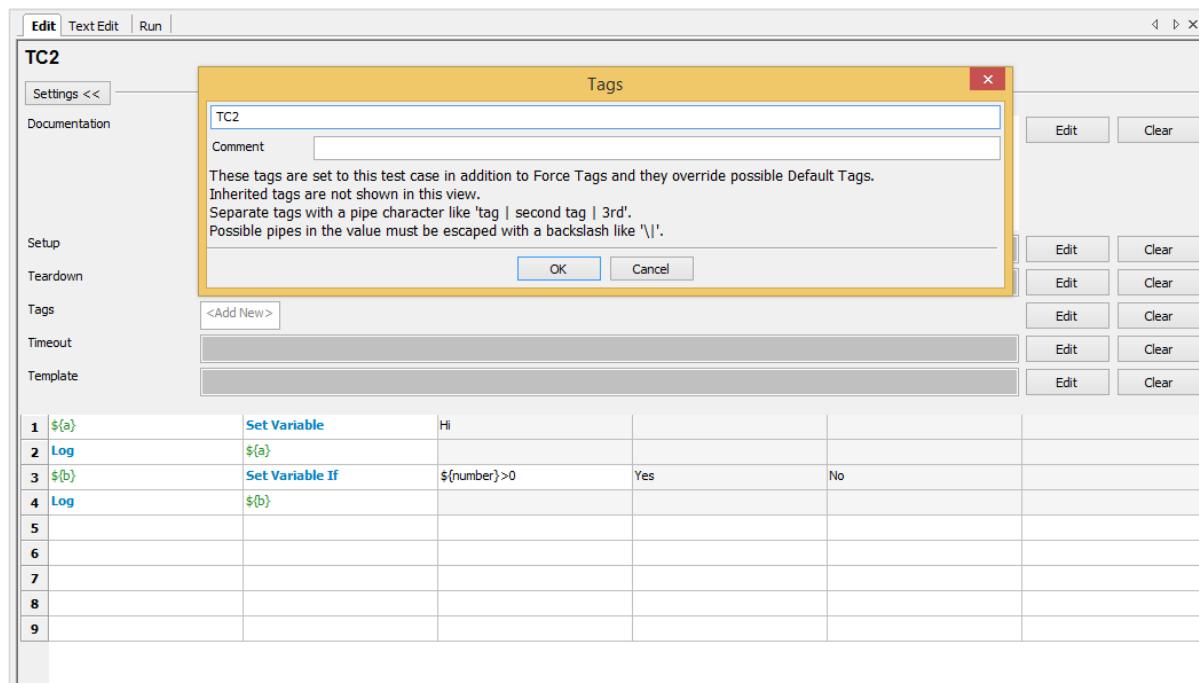

```

Elapsed time: 0:00:17 pass: 0 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEoeebjs.d\argfile.txt --listener C:\Python27\lib\site-packages\robot\reporter\html.py
unable to open socket to "localhost:59445" error: [Errno 10061] No connection could be made because the target machine actively refused it.
=====
WritingTestCases
=====
WritingTestCases.Test suite 1
=====
TC1 | PASS |
TC2 | PASS |
=====
WritingTestCases.Test suite 1
2 critical tests, 2 passed, 0 failed
2 tests total, 2 passed, 0 failed
=====
WritingTestCases | PASS |
2 critical tests, 2 passed, 0 failed
2 tests total, 2 passed, 0 failed
=====
Output: c:\users\kamat\appdata\local\temp\RIDEoeebjs.d\output.xml
Log: c:\users\kamat\appdata\local\temp\RIDEoeebjs.d\log.html
Report: c:\users\kamat\appdata\local\temp\RIDEoeebjs.d\report.html
test finished 20181021 17:23:36

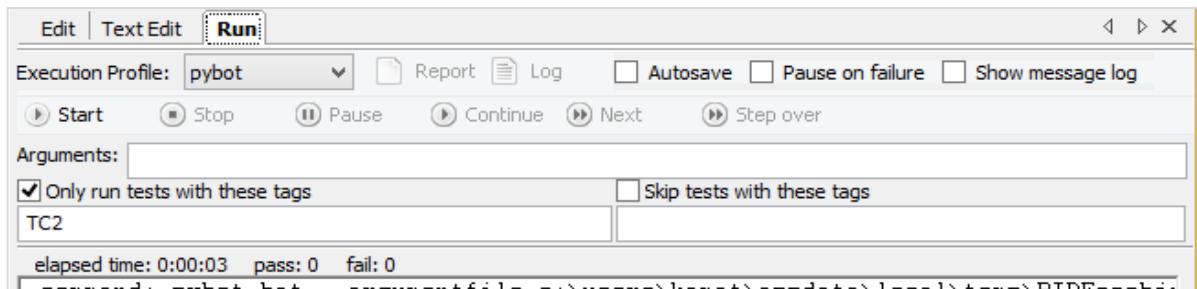

```

## Using Tags for Executing Test Case

In case you want to run only test case TC2, you can tag the same. Click on the test case and click Edit across Tags as shown below:

Click Ok to save the tag. Add the tag name in Run as shown below:

We have selected option -> **Only run tests with these tags** and added tag name in it. Now, it will run only those test cases that have tag names. You can give any name and group the test cases based on tag name and run the same. You can also use tag to skip the test case.

```

Edit | Text Edit | Run
Execution Profile: pybot | Report | Log | Autosave | Pause on failure | Show message log
Start | Stop | Pause | Continue | Next | Step over
Arguments:
 Only run tests with these tags  Skip tests with these tags
TC2
elapsed time: 0:00:03 pass: 0 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEoeebj
unable to open socket to "localhost:59445" error: [Errno 10061] No connection
=====
WritingTestCases
=====
WritingTestCases.Test suite 1
=====
TC2
=====
WritingTestCases.Test suite 1
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
WritingTestCases
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDEoeebjs.d\output.xml
Log:   c:\users\appdata\local\temp\RIDEoeebjs.d\log.html
Report: c:\users\appdata\local\temp\RIDEoeebjs.d\report.html
test finished 20181021 17:27:11

```

Now we can see only TC2 running when executed.

## Use Resource Files for Test Case

Robot framework has option for resource, where you can import robot files to be used with the test cases.

Test case TC1 that we have created uses the following keywords:

1	Open Browser	https://www.tutorialspoint.com/	chrome		
2	Maximize Browser Window				
3	Close Browser				
4					
5					
6					
7					
8					

We have used Keywords like:

- Open Browser
- Maximize Browser Window
- Close Browser

We will use a user-defined keyword for the above test case. The user-defined keyword will be available in the robot file which will be used as a resource.

We will create a file in the same directory and write our keyword as follows:

Please note details of keywords, i.e., how to create user-defined keywords are explained in *Robot Framework - Working with Keywords* chapter.

We have created a user-defined keyword called **Test Browser** as shown in the *browseropen.robot* file:

```
*** Settings ***
Library           SeleniumLibrary

*** Variables ***
${url}          https://www.tutorialspoint.com/
${browser}        chrome

*** Keywords ***
Test Browser
    Open Browser    ${url}    ${browser}
    Maximize Browser Window
```

The file contains various options such as Settings, Variables, and Keywords. Please note, we cannot write test case inside the file to be used as resource. We will upload the above file as resource for the test suite as shown below.

Select the test suite. On the left side, click on resource option as shown below:

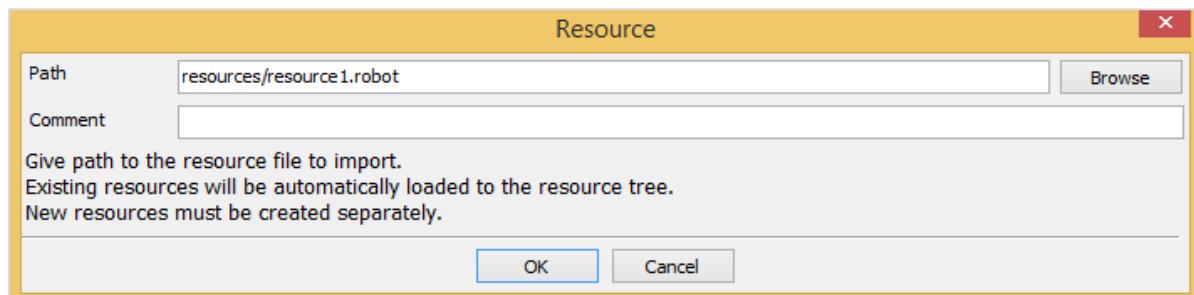

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

Variable	Value	Comment
<code>\$(number)</code>	100	

Add Import  
 Library  
**Resource**  
 Variables  
 Import Failed Help  
  
 Add Scalar  
 Add List  
 Add Dict

Click on Resource and it will ask the path to import robot file:

Mention the path where the file is stored as shown above and click OK to add resource. It will be displayed as shown below:

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		
Resource	<code>resources/resource1.robot</code>		

Variable	Value	Comment
<code>\$(number)</code>	100	

Add Import  
 Library  
**Resource**  
 Variables  
 Import Failed Help  
  
 Add Scalar  
 Add List  
 Add Dict

Now, we will change test case TC1 which has keywords as shown below:

1	Open Browser	https://www.tutorialspoint.com/	chrome		
2	Maximize Browser Window				
3	Close Browser				
4					
5					
6					
7					
8					

We will add the user-defined keyword to TC1 from the resource file, i.e., Test Browser keyword:

1	Test Browser	
2	Close Browser	
3		
4		
5		
6		
7		

The resource file uploaded is as shown below:

The screenshot shows the Robot Framework Test Case Runner. On the left, there is a tree view of a project named 'WritingTestCases'. It contains a 'Test suite 1' folder with two test cases: 'TC1' and 'TC2'. Underneath 'Test suite 1' is a 'Resources' folder containing three files: 'browseropen.robot', 'resource1.robot', and 'resource1.robot'. The 'resource1.robot' file is selected and its content is displayed in the main window. The main window has tabs for 'Edit', 'Text Edit' (which is selected), and 'Run'. It also has buttons for 'Apply Changes', 'Search', and a search input field. The 'Text Edit' tab displays the following code:

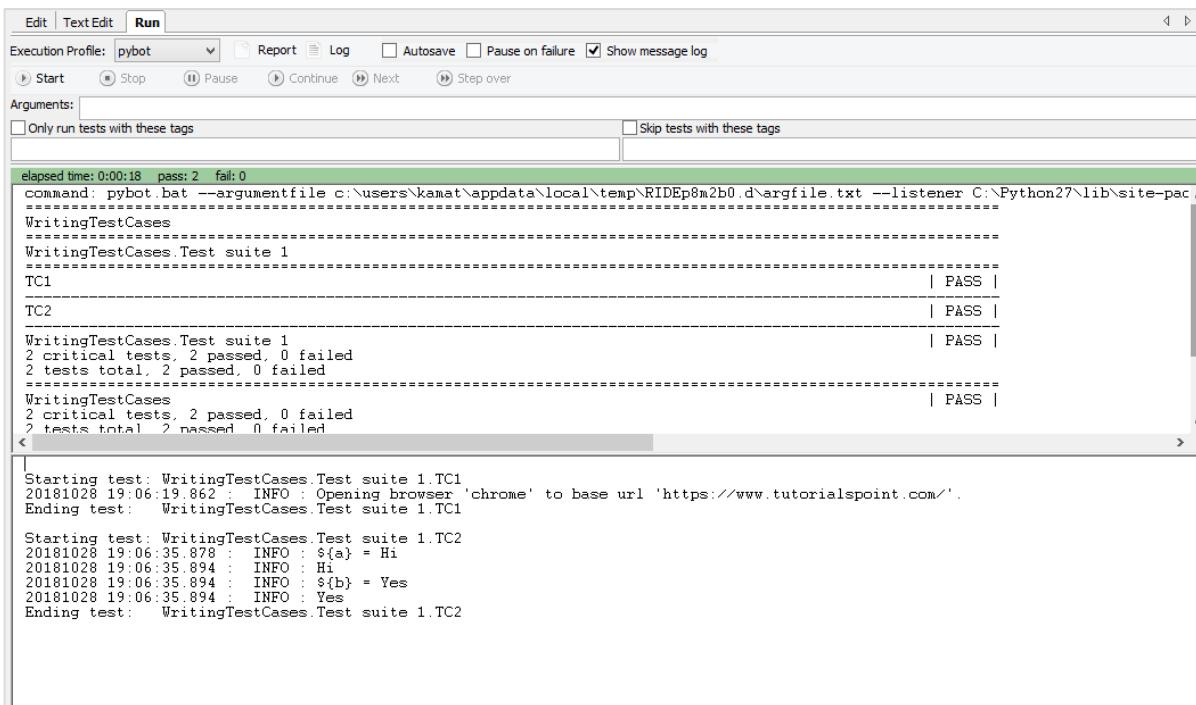

```

1 *** Settings ***
2 Library    SeleniumLibrary
3
4 *** Variables ***
5 ${url}      https://www.tutorialspoint.com/
6 ${browser}   chrome
7
8 *** Keywords ***
9 Test Browser
10 Open Browser ${url} ${browser}
11 Maximize Browser Window
12

```

The user-defined Keyword is used in test case TC1.

We will now execute the test case:

The screenshot shows the Robot Framework Test Runner window. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. The 'Run' tab is selected. Below it, the 'Execution Profile' dropdown is set to 'pybot'. There are buttons for 'Start', 'Stop', 'Pause', 'Continue', 'Next', and 'Step over'. A checkbox 'Autosave' is unchecked, and another 'Pause on failure' is checked. A 'Show message log' checkbox is checked. The 'Arguments' field contains an empty string. Below these are two checkboxes: 'Only run tests with these tags' and 'Skip tests with these tags'. The main area displays the test log output.

```
Elapsed time: 0:00:18 pass: 2 fail: 0
command: pybot bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEp8m2b0.d\argfile.txt --listener C:\Python27\lib\site-packages\robot\reporter\html.py

  - Status: 2 critical test, 2 passed, 0 failed  
2 test total, 2 passed, 0 failed
  - + **TEST** TC1
  - + **TEST** TC2

## Conclusion

This chapter gives details on how to write test case, execute it, how to tag a test-case, use resources, etc.

# 7. Robot framework — Keyword and Data Driven Test Cases

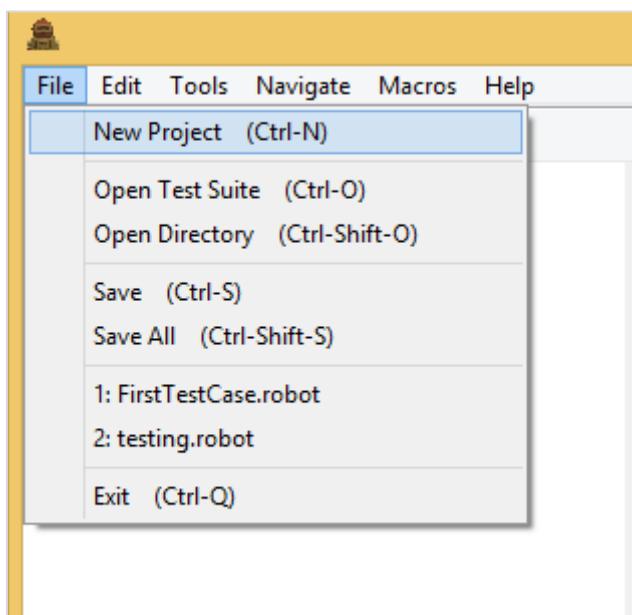

The workflow of a test-case can be tested using keyword or data driven style. In case you want to test the workflow with different inputs, the same can be done using data driven test cases. We will work on an example to go through the following test case approaches:

- Keyword Driven style
- Data Driven style

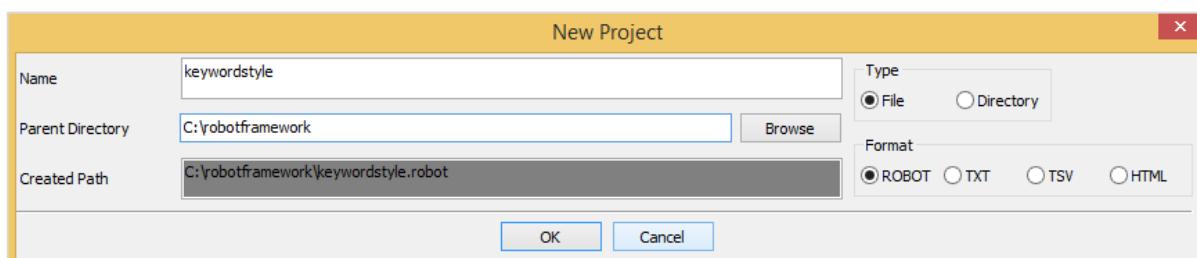

## Keyword Driven Style

We will do a project setup to show the working of Keyword driven style.

Open ride using **ride.py** from the command line.

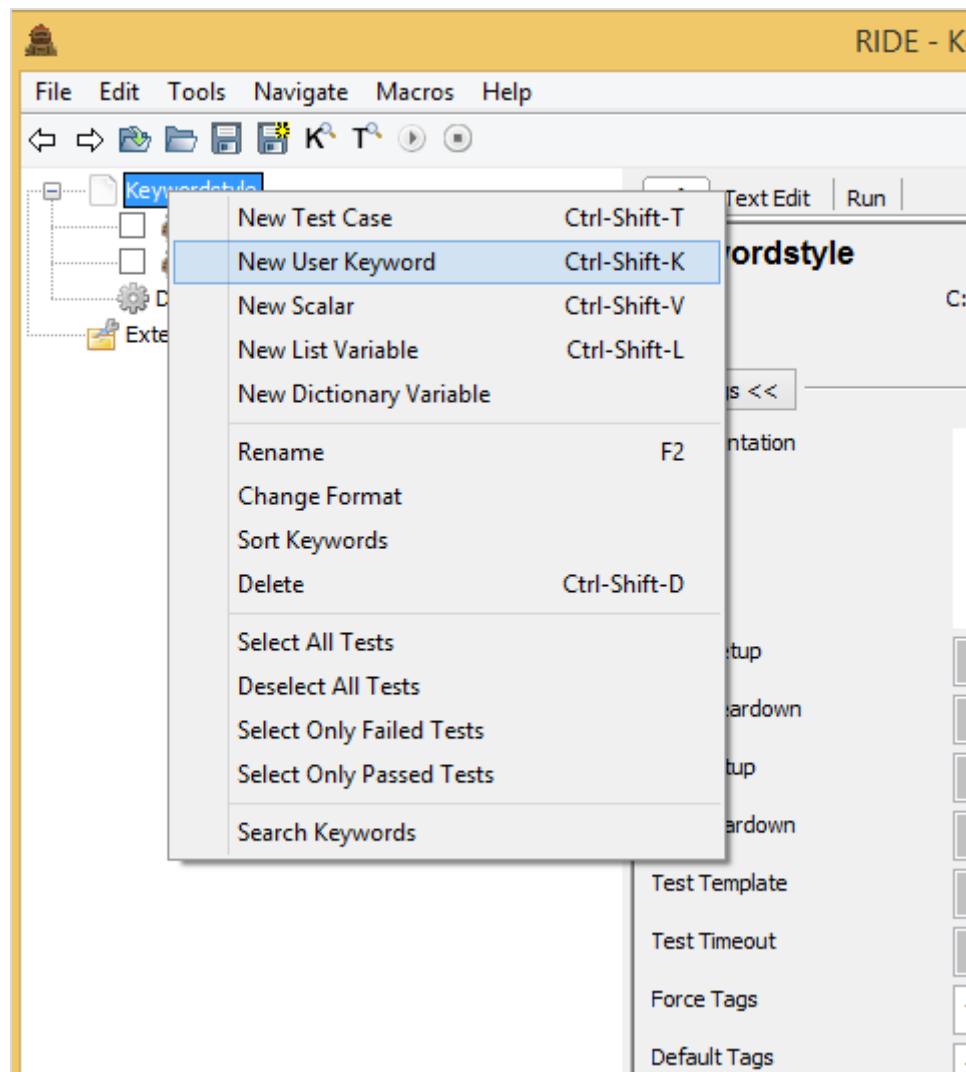

Click on *New Project* and give a name to your project.

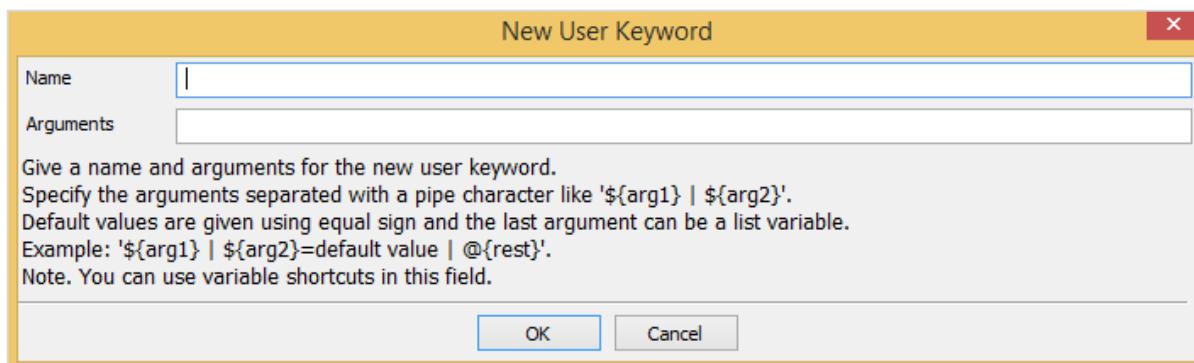

The name given to the project is *keywordstyle*. Click *OK* to save the project. In this project, we will create a user keyword as shown below.

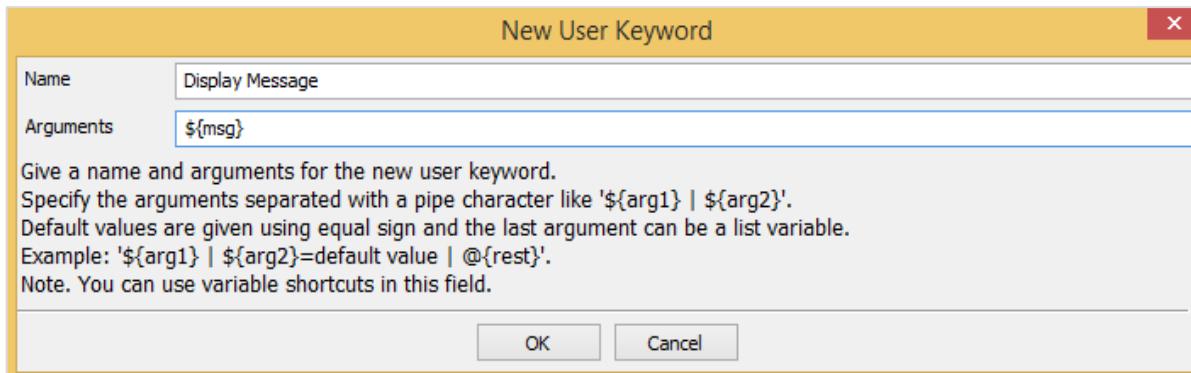

Right-click on the name of the project and click on *New User Keyword* as shown below:

It will display screen as follows:

Enter the name of the keyword and the arguments it will take. Here we will give name of the keyword as *Display Message*. The role of Keyword *Display Message* is, when it is called, it will log a message. So we need to give an argument to it. Therefore, in the above example the argument will be a scalar variable \${msg}.

Click *OK* to save the user keyword. Now we need to write the action the keywords need to do. So, it will have tabular format as shown below where we can give the Library keywords or built-in keywords available with Robot Framework.

Here, we will use a simple Log keyword available with Robot Framework as shown below:

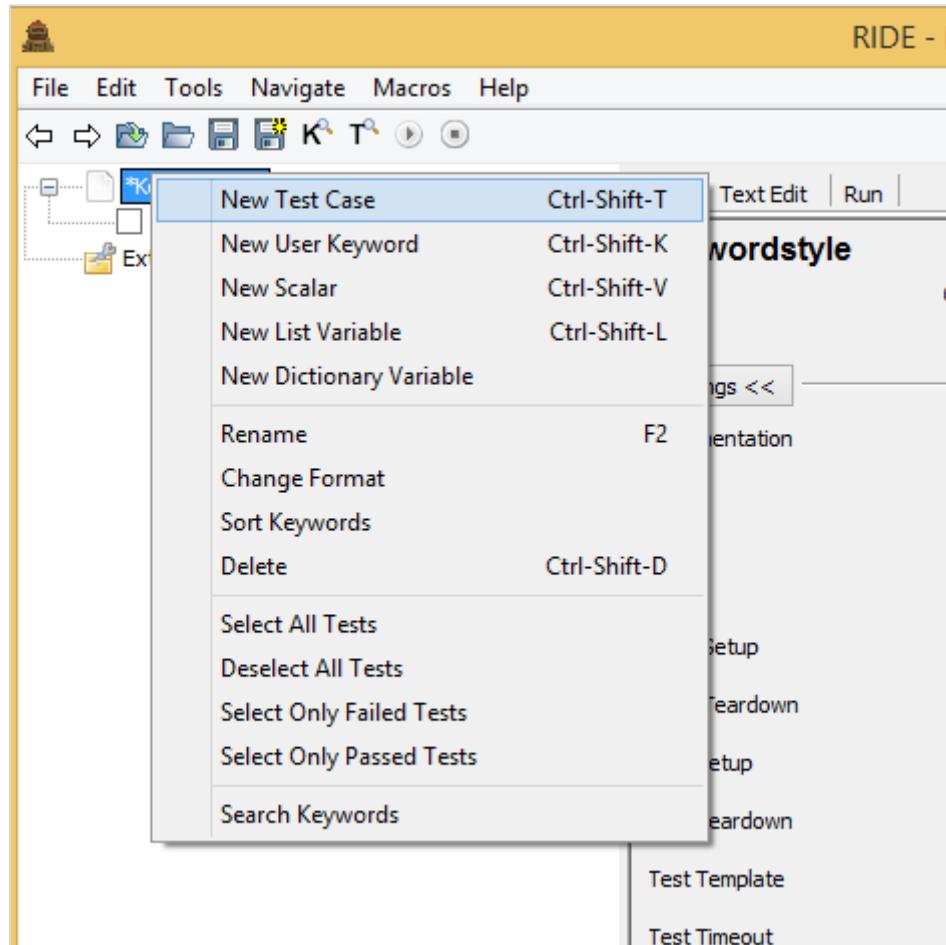

1	<b>Log</b>	\${msg}	
2			
3			
4			
5			
6			

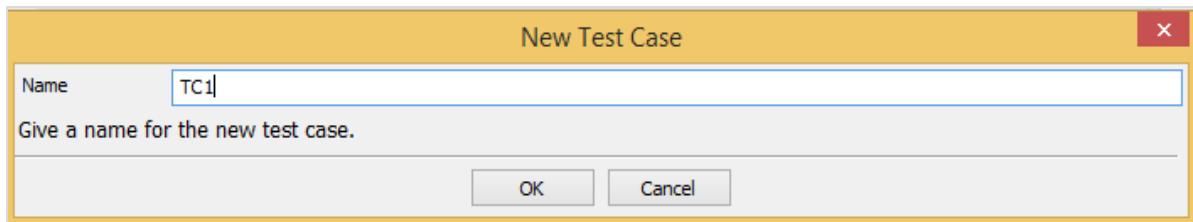

To get more keywords available with Robot framework, press **ctrl + space bar** in the table column as shown below:

1	Log	\${msg}
2		
3	Convert To Integer	
4	Convert To Number	
5	Convert To Octal	
6	Convert To String	
	Create Dictionary	
	Create List	
	Evaluate	
	Exit For Loop	
	Exit For Loop If	
	Fail	
	<small>Final Error</small>	

So the keyword we want to use with our testcase is ready. The name of the user keyword is *Display Message* and it takes one argument called  **\${msg}**.

Let us now use this keyword in simple keyword driven style test-case. To do that we need to create test case. Right-click on the name of the project created. Now, click *New Test Case*:

Give name to the test case and click OK.

We are done with the project setup and now will write test cases for the keyword driven style.

In the test case, we have used the user-defined keyword *Display Message* in the tabular format as shown below:

1	Display Message	Hello World
2		
3		
4		
5		[Redacted]
6		

We have used the keyword we have created as shown above and passed the value Hello World.

We will execute the test case TC1 and check the output:

```
elapsed time: 0:00:01  pass: 1  fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEcdkk0i.d
=====
Keywordstyle
=====
TC1 | PASS |
=====
Keywordstyle
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDEcdkk0i.d\output.xml
Log:   c:\users\appdata\local\temp\RIDEcdkk0i.d\log.html
Report: c:\users\appdata\local\temp\RIDEcdkk0i.d\report.html

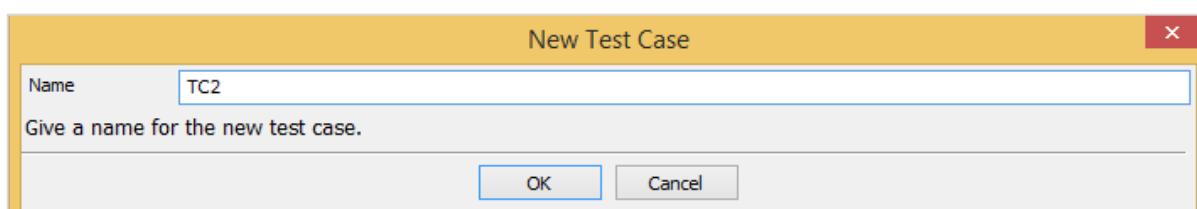

test finished 20181027 12:35:41

< >
Starting test: Keywordstyle.TC1
20181027 12:35:41.490 : INFO : Hello World
Ending test: Keywordstyle.TC1
```

In the above example, we have written a simple test-case which logs message and the test case is executed with output *Hello World*. We can see the output Hello World printed in the log. The test case is also passed here.

## Data Driven Style

We will create one more test case in the same project. We will give the name of the test-case as TC2.

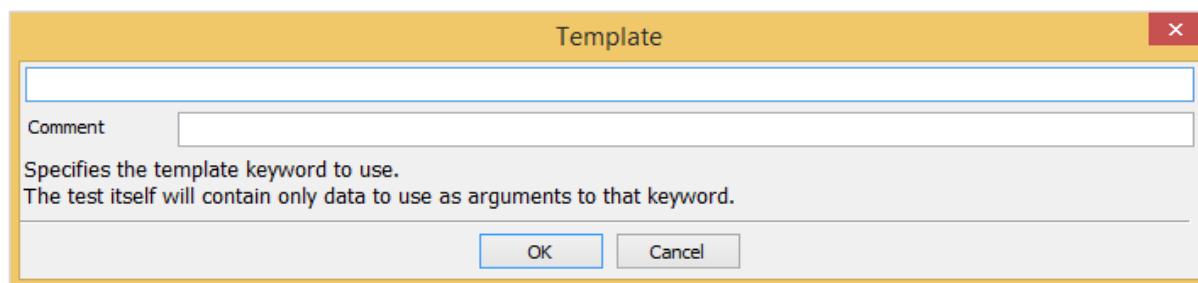

To work with data driven style, we need to create template. Template will take the name of the high level keyword, which is a user-defined keyword like the one we created at the start called *Display Message*. The arguments to that template will be sent in the form of test-cases. We can pass different values to that template keyword. The data driven approach is mostly used when you want to test the scenario with different data to it.

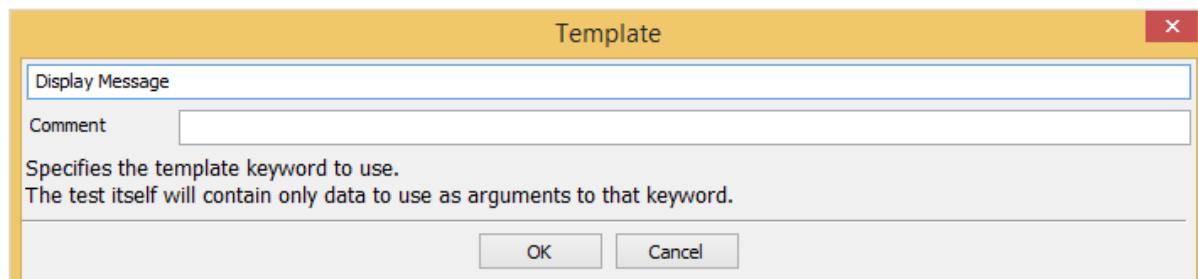

Once the test case is saved. Click on the test case and the display will be as follows:

The screenshot shows the TC2 configuration interface. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. Below the tabs, the title 'TC2' is displayed. On the left side, there are sections for 'Documentation', 'Setup', 'Teardown', 'Tags', 'Timeout', and 'Template'. Each section has a large input field and two buttons: 'Edit' and 'Clear'. Under the 'Template' section, there is a table with 7 rows, each containing a number from 1 to 7. The 'Tags' section contains a button labeled '<Add New>'.

Click on Edit button for Template and add the user-defined keyword.

Enter the user keyword for the template and click OK to save the template.

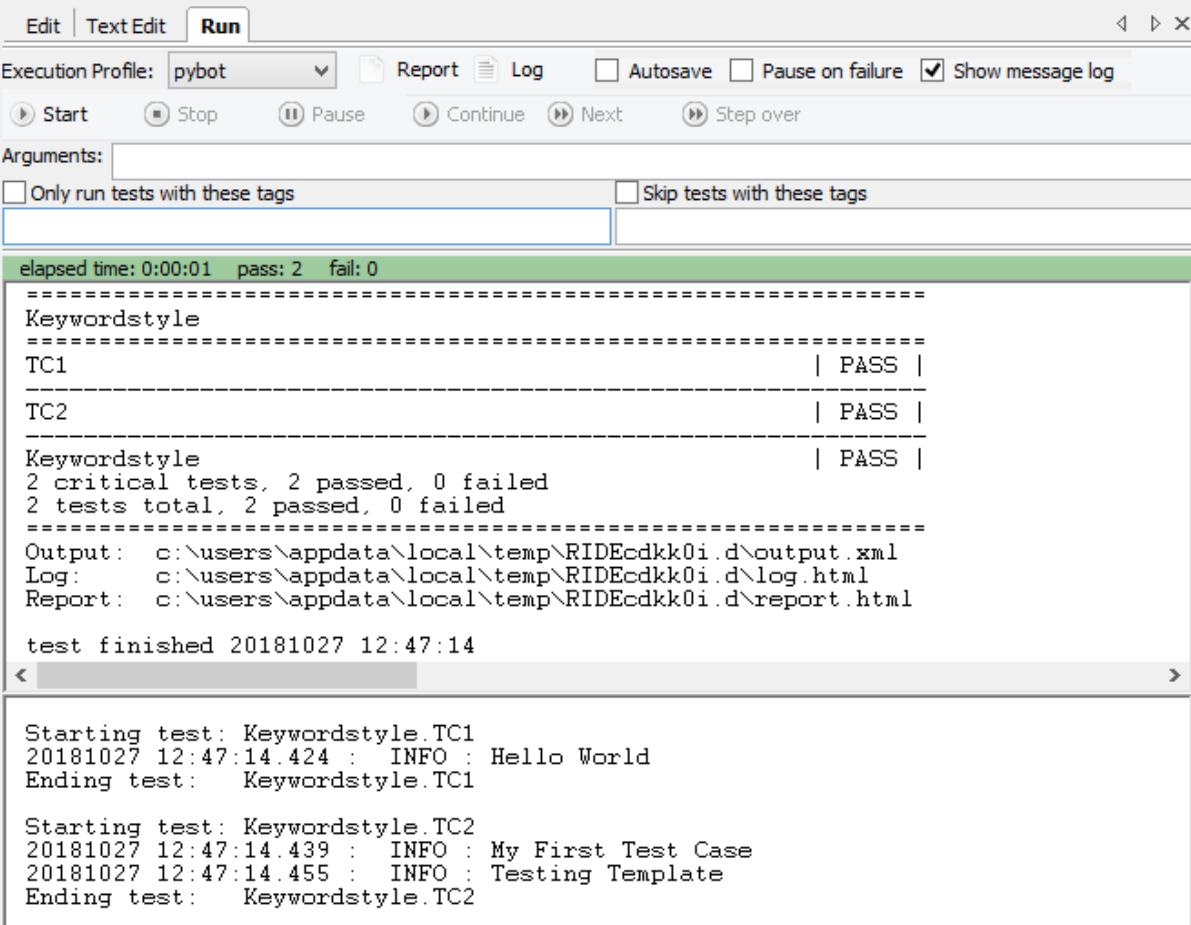

*Display Message* keyword takes one argument called \${msg}. This is a scalar variable. The details passed in this test case will act as arguments to the user-defined keyword *Display Message*.

The screenshot shows the Robot Framework Test Case Editor interface. At the top, there are tabs for 'Edit' (which is selected), 'Text Edit', and 'Run'. Below the tabs, the title 'TC2' is displayed. Under 'Settings <<', there is a 'Documentation' section with 'Edit' and 'Clear' buttons. The main configuration area contains sections for 'Setup', 'Teardown', 'Tags', 'Timeout', and 'Template'. The 'Template' section has a value of '[Display Message](#)' with 'Edit' and 'Clear' buttons. Below this is a table with 7 rows, indexed from 1 to 7. Row 1 contains 'My First Test Case'. Row 2 contains 'Testing Template'. Rows 3 through 6 are empty. Row 7 contains a redacted value.

1	My First Test Case			
2	Testing Template			
3				
4				
5				
6				
7	[REDACTED]			

In TC2, we have added Template *Display Message* (user-defined keyword). We have given messages in the tabular format.

Let us now execute the test case.

The screenshot shows the Robot Framework Test Runner window. The 'Run' tab is selected. In the arguments section, there are checkboxes for 'Only run tests with these tags' and 'Skip tests with these tags', neither of which is checked. Below this, the test results are displayed:

```

elapsed time: 0:00:01  pass: 2  fail: 0
=====
Keywordstyle
=====
TC1 | PASS |
-----
TC2 | PASS |
=====
Keywordstyle
2 critical tests, 2 passed, 0 failed
2 tests total, 2 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDEcdkk0i.d\output.xml
Log:   c:\users\appdata\local\temp\RIDEcdkk0i.d\log.html
Report: c:\users\appdata\local\temp\RIDEcdkk0i.d\report.html
test finished 20181027 12:47:14
< >
Starting test: Keywordstyle.TC1
20181027 12:47:14.424 : INFO : Hello World
Ending test:   Keywordstyle.TC1

Starting test: Keywordstyle.TC2
20181027 12:47:14.439 : INFO : My First Test Case
20181027 12:47:14.455 : INFO : Testing Template
Ending test:   Keywordstyle.TC2

```

We can see Run executes both the Test Cases. The output shown for TC1 is Hello World. This was the message we had given to the User Keyword Display Message.

For TC2, we used Display Message as a Template. We passed *My First Test Case* and *Testing Template* as values in TC2. As the user keyword Display Message uses internally Log Keyword, it displays the message in the log as shown above.

## Conclusion

We have used keyword style and data driven style in this chapter and seen the working of both. Data Driven style takes high-level user-defined keyword as a template and all the test cases act as values to the template.

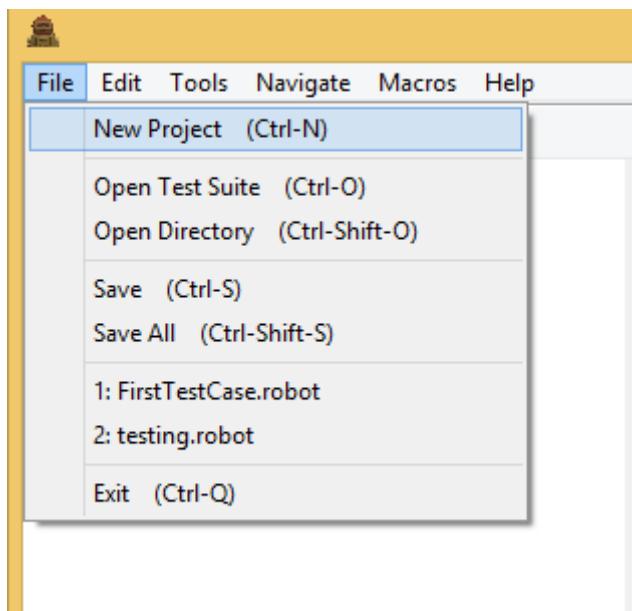

# 8. Robot — Working With Browsers Using Selenium Library

In this chapter, we will learn how to work with browsers using Robot Framework and Selenium Library in ride.

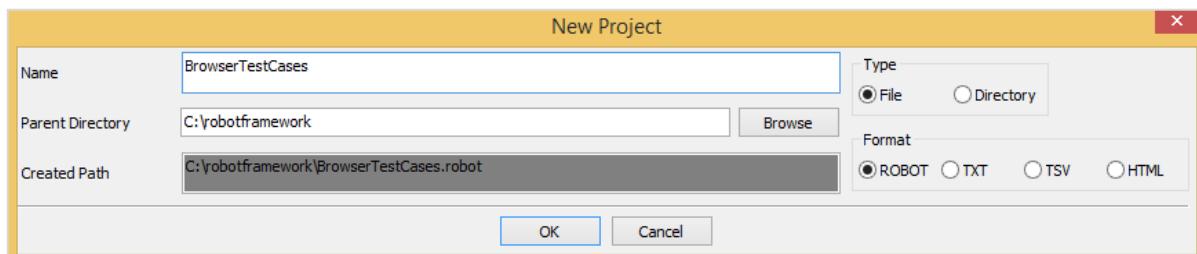

- Project setup in Ride
- Import Selenium Library
- Test case using Chrome Browser
- Test case using Firefox Browser

## Project Setup In Ride

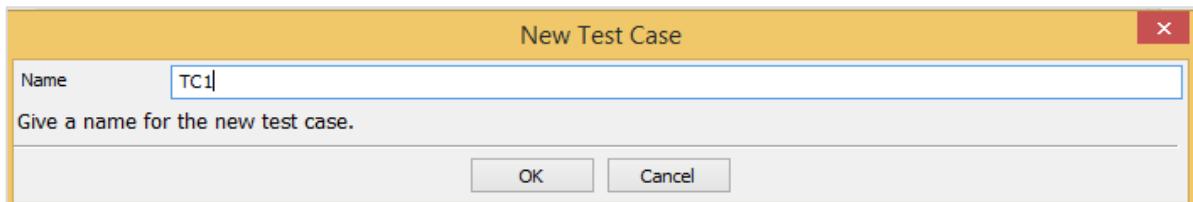

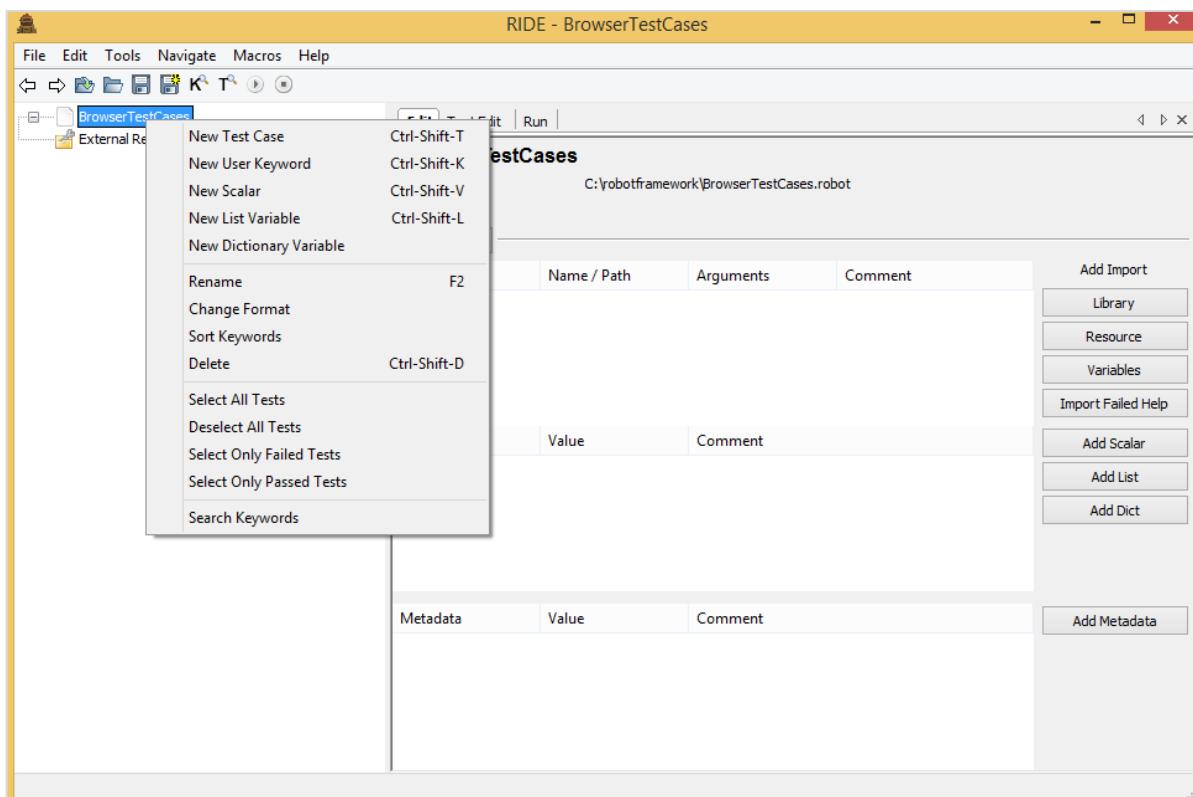

We will first create a project in Ride to work with browsers. Open ride using ride.py from the command line.

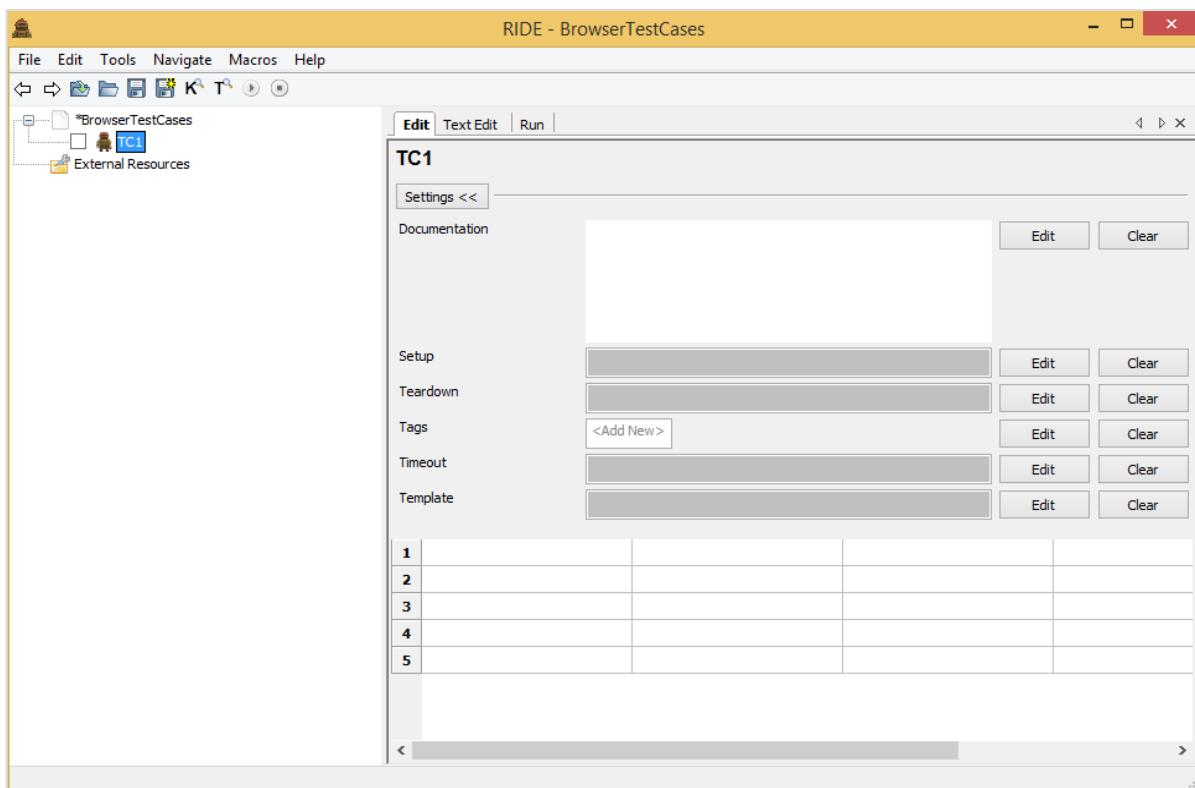

Click on *New Project* and give name to your project.

The name given is BrowserTestCases. Click OK to save the project. Right-click on the name of the project created and click on *New Test Case*:

Give name to the test case and click OK.

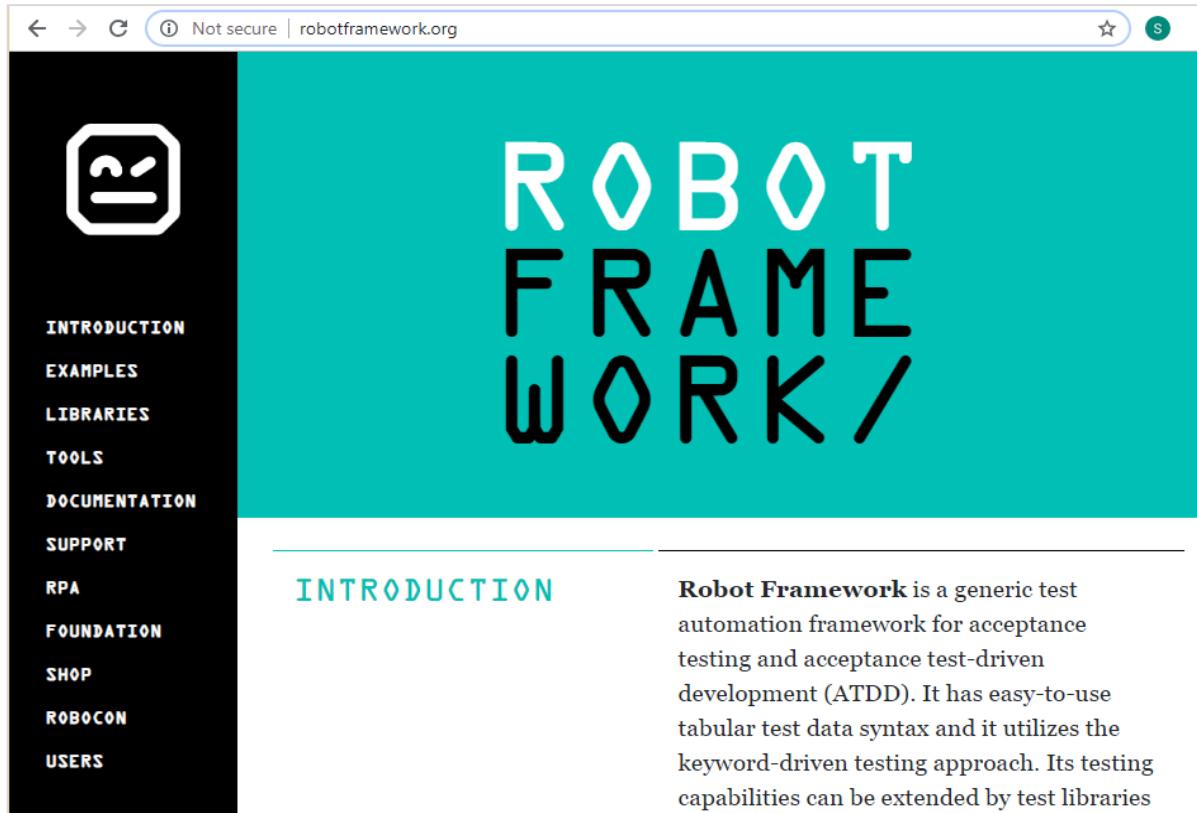

We are done with the project setup. Now, we will write test cases for the browser.

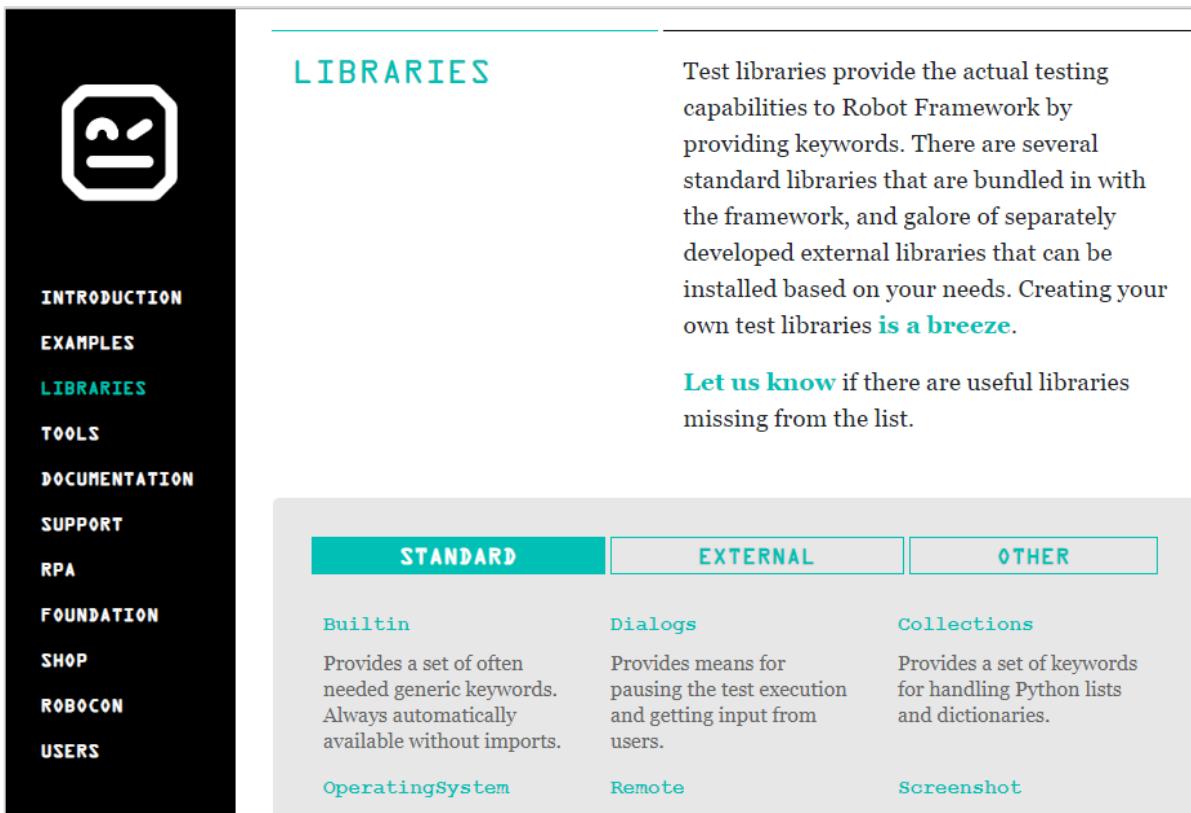

## Import Selenium Library

To work with browsers, we need selenium library to be imported in robot. We can do that as follows:

Go to <http://robotframework.org/>

On the left side, select the LIBRARIES option.

The screenshot shows the 'LIBRARIES' section of the Robot Framework documentation. On the left, there's a sidebar with navigation links: INTRODUCTION, EXAMPLES, LIBRARIES (which is the current page), TOOLS, DOCUMENTATION, SUPPORT, RPA, FOUNDATION, SHOP, ROBOCON, and USERS. The main content area has a teal header 'LIBRARIES'. Below it, a teal box contains the text: 'Test libraries provide the actual testing capabilities to Robot Framework by providing keywords. There are several standard libraries that are bundled in with the framework, and galore of separately developed external libraries that can be installed based on your needs. Creating your own test libraries **is a breeze.**' It also says 'Let us know if there are useful libraries missing from the list.' At the bottom, there's a table with three columns: STANDARD, EXTERNAL (which is highlighted in teal), and OTHER. The STANDARD column lists 'BuiltIn' and 'OperatingSystem'. The EXTERNAL column lists 'Dialogs' and 'Remote'. The OTHER column lists 'Collections' and 'Screenshot'.

STANDARD	EXTERNAL	OTHER
<a href="#">BuiltIn</a>	<a href="#">Dialogs</a>	<a href="#">Collections</a>
Provides a set of often needed generic keywords. Always automatically available without imports.	Provides means for pausing the test execution and getting input from users.	Provides a set of keywords for handling Python lists and dictionaries.
<a href="#">OperatingSystem</a>	<a href="#">Remote</a>	<a href="#">Screenshot</a>

Select External option from above and it will list you all the libraries available to be used.

STANDARD	EXTERNAL	OTHER
<b>Android library</b> Library for all your Android automation needs. It uses Calabash Android internally.	<b>AnywhereLibrary</b> Library for testing Single-Page Apps (SPA). Uses Selenium Webdriver and Appium internally.	<b>AppiumLibrary</b> Library for Android- and iOS-testing. It uses Appium internally.
<b>Archive library</b> Library for handling zip- and tar-archives.	<b>AutoItLibrary</b> Windows GUI testing library that uses AutoIt freeware tool as a driver.	<b>CncLibrary</b> Library for driving a CNC milling machine.
<b>RESTinstance</b> Robot Framework test library for HTTP JSON APIs.	<b>SapGuiLibrary</b> Library for testing the SAPGUI client using the internal SAP Scripting Engine	<b>SeleniumLibrary</b> Web testing library that uses popular Selenium tool internally.
<b>Selenium2Library</b> Web testing library that uses Selenium 2. Library is deprecated; users should upgrade to SeleniumLibrary described above.	<b>Selenium2Library for Java</b> Java port of the Selenium2Library.	<b>ExtendedSelenium2Library</b> Web testing library that uses Selenium2Library internally, providing AngularJS support on top of it.

Click [SeleniumLibrary](#).

You will be redirected to the github repo as shown below:

See [keyword documentation](#) for available keywords and more information about the library in general.

## Installation

The recommended installation method is using [pip](#):

```
pip install --upgrade robotframework-seleniumlibrary
```

Running this command installs also the latest Selenium and Robot Framework versions, but you still need to install [browser drivers](#) separately. The `--upgrade` option can be omitted when installing the library for the first time.

Those migrating from [Selenium2Library](#) can install SeleniumLibrary so that it is exposed also as Selenium2Library:

```
pip install --upgrade robotframework-selenium2library
```

The above command installs the normal SeleniumLibrary as well as a new Selenium2Library version that is just a thin wrapper to SeleniumLibrary. That allows importing Selenium2Library in tests while migrating to SeleniumLibrary.

To install the last legacy [Selenium2Library](#) version, use this command instead:

```
pip install robotframework-selenium2library==1.8.0
```

With recent versions of `pip` it is possible to install directly from the [GitHub](#) repository. To install latest source from the master

For Installation of seleniumlibrary, we can use the command from the github and install it using pip.

## Command

```
pip install --upgrade robotframework-seleniumlibrary
```

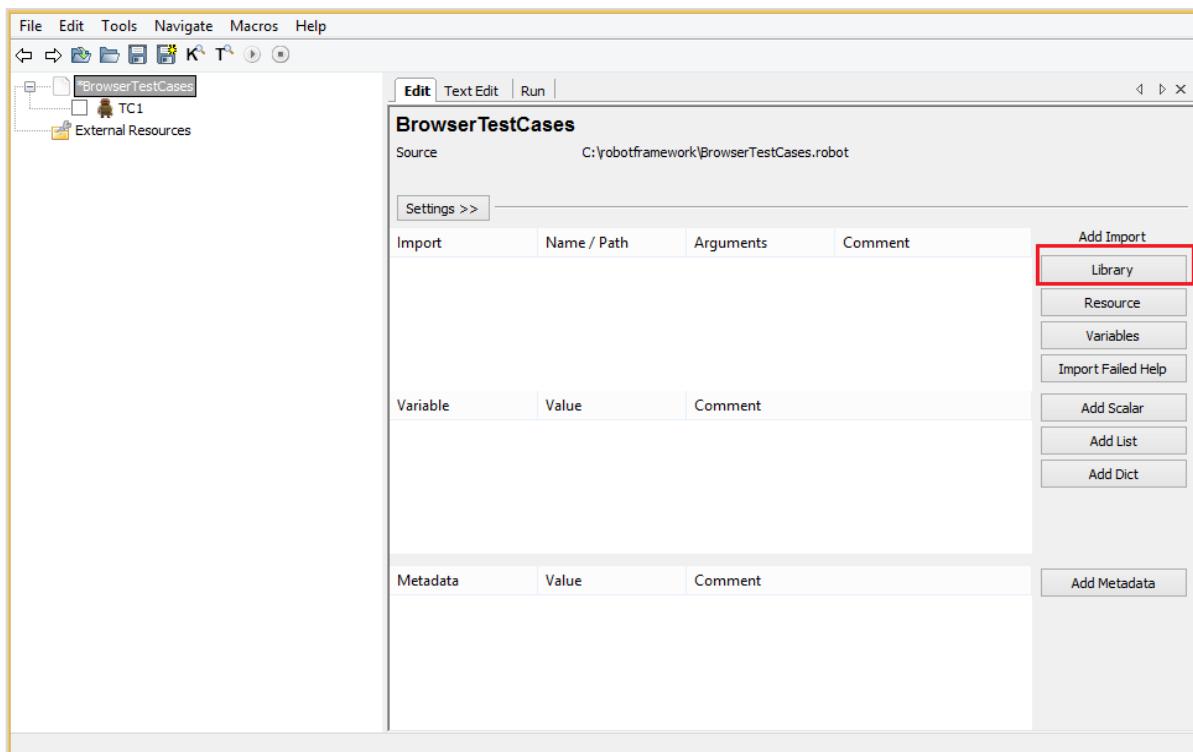

```
C:\robotframework>pip install --upgrade robotframework-seleniumlibrary
Collecting robotframework-seleniumlibrary
  Downloading https://files.pythonhosted.org/packages/74/e9/19f4f96e1f35ed34e5f9d06d8285f981d2b8c5e7efa23d5c201c4650d732/robotframework_seleniumlibrary-3.2.0-py2.py3-none-any.whl (79kB)
    100% ##### 81kB 405kB/s
Collecting selenium>=3.4.0 (from robotframework-seleniumlibrary)
-
```

Selenium library gets installed inside the lib folder in python as follows:

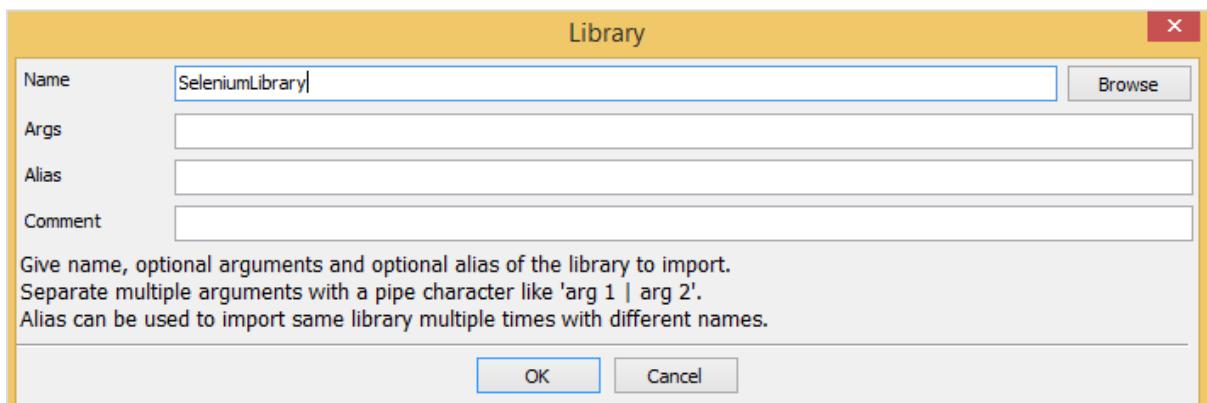

Name	Date modified	Type	Size
pip	06-10-2018 16:10	File folder	
pip-9.0.3.dist-info	06-10-2018 16:10	File folder

easy_install		06-10-2018 16:10	Compiled Python ...
README		13-02-2017 22:38	Text Document

Once the installation is done, we have to import the library in Ride as shown in the below steps.

Click on your project on the left side and use Library from Add Import:

Upon clicking Library, a screen will appear wherein you need to enter the library name:

Click OK and the library will get displayed in the settings.

The screenshot shows the 'Edit' tab of the Robot Framework Test Case Editor. The title bar says 'Edit Text Edit Run'. The main area is titled 'BrowserTestCases' and shows the source file as 'C:\robotframework\BrowserTestCases.robot'. A 'Settings >>' button is visible. On the right, there's a sidebar with an 'Add Import' dropdown menu open, showing options like 'Library' (which is selected), 'Resource', 'Variables', 'Import Failed Help', 'Add Scalar', 'Add List', and 'Add Dict'. Below this are sections for 'Variable' and 'Metadata', both of which are currently empty.

The name given has to match with the name of the folder installed in site-packages. In case the names do not match, the library name will be in red as shown below:

Edit Text Edit Run

### BrowserTestCases

Source C:\robotframework\BrowserTestCases.robot

Settings >>

Import	Name / Path	Arguments	Comment	Add Import
Library	SeleniumLibrary			Library
Library	seleniumlibrary			Resource

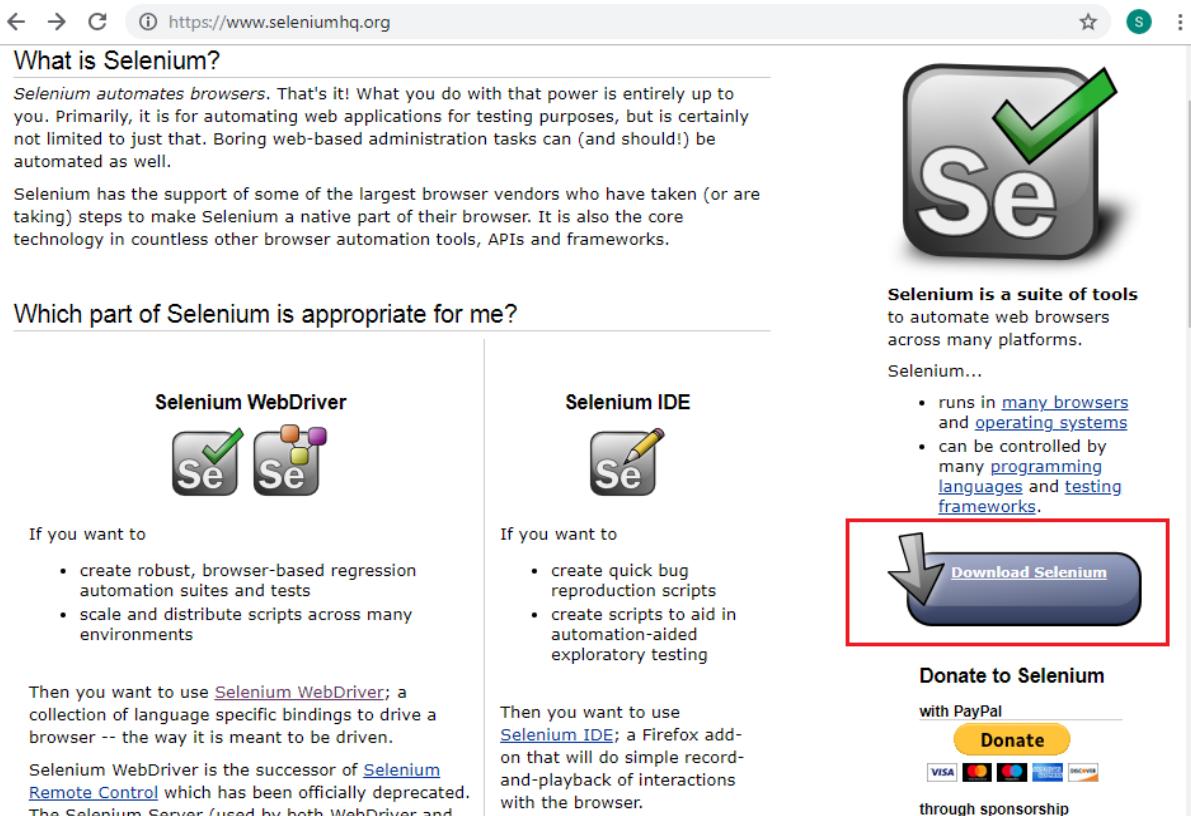

Variable	Value	Comment	Add Scalar
			Add List
			Add Dict

Metadata	Value	Comment	Add Metadata

Library import in red is as good as the library does not exist inside python. Now, we have completed selenium library import.

## Test Case Using Chrome Browser

To work with Chrome browser in Robot, we need to first install the drivers for chrome to work with Selenium. The drives are available on Selenium site – <https://www.seleniumhq.org/>.

The screenshot shows a web browser displaying the Selenium homepage at <https://www.seleniumhq.org/>. The page has a header with the Selenium logo (a stylized 'Se' with a green checkmark). Below the header, there's a section titled "What is Selenium?" with a brief description and another section titled "Which part of Selenium is appropriate for me?". Under "Which part of Selenium is appropriate for me?", there are two main sections: "Selenium WebDriver" and "Selenium IDE". Each section has a description, icons, and a list of features. To the right of these sections is a sidebar with a large "Download Selenium" button, a "Donate to Selenium" section, and payment method icons.

**What is Selenium?**

Selenium automates browsers. That's it! What you do with that power is entirely up to you. Primarily, it is for automating web applications for testing purposes, but is certainly not limited to just that. Boring web-based administration tasks can (and should!) be automated as well.

Selenium has the support of some of the largest browser vendors who have taken (or are taking) steps to make Selenium a native part of their browser. It is also the core technology in countless other browser automation tools, APIs and frameworks.

**Which part of Selenium is appropriate for me?**

<b>Selenium WebDriver</b>  If you want to <ul style="list-style-type: none"> <li>• create robust, browser-based regression automation suites and tests</li> <li>• scale and distribute scripts across many environments</li> </ul> Then you want to use <a href="#">Selenium WebDriver</a> ; a collection of language specific bindings to drive a browser -- the way it is meant to be driven. Selenium WebDriver is the successor of <a href="#">Selenium Remote Control</a> which has been officially deprecated. The Selenium Server (used by both WebDriver and	<b>Selenium IDE</b>  If you want to <ul style="list-style-type: none"> <li>• create quick bug reproduction scripts</li> <li>• create scripts to aid in automation-aided exploratory testing</li> </ul> Then you want to use <a href="#">Selenium IDE</a> ; a Firefox add-on that will do simple record-and-playback of interactions with the browser.

## ChromeDriver

WebDriver is an open source tool for automated testing of webapps across many browsers. It provides capabilities for navigating to web pages, user input, JavaScript execution, and more. ChromeDriver is a standalone server which implements WebDriver's wire protocol for Chromium. We are in the process of implementing and moving to the W3C standard. ChromeDriver is available for Chrome on Android and Chrome on Desktop (Mac, Linux, Windows and ChromeOS).

You can view the current implementation status of the WebDriver standard [here](#).

**Latest Release: ChromeDriver 2.42**

- All versions available in Downloads

**ChromeDriver Documentation**

- Getting started with ChromeDriver on Desktop (Windows, Mac, Linux)
  - ChromeDriver with Android
  - ChromeDriver with ChromeOS
- ChromeOptions, the capabilities of ChromeDriver

Click on the latest release. It will display the downloads as per the operating system – windows, linux and mac.

## Index of /2.42/

Name	Last modified	Size	ETag
<a href="#">Parent Directory</a>		-	
<a href="#">chromedriver_linux64.zip</a>	2018-09-13 19:30:37	3.85MB	acfcc29fb03df9e913ef4c360a121ad1
<a href="#">chromedriver_mac64.zip</a>	2018-09-13 18:14:11	5.75MB	3fc0e4a97cbf2c8c2a9b824d95e25351
<a href="#">chromedriver_win32.zip</a>	2018-09-13 21:11:33	3.42MB	28d91b31311146250e7ef1afbcd6d026
<a href="#">notes.txt</a>	2018-09-13 21:23:09	0.02MB	18bdf6fc9f9d8dd668fa444b77d06bdd

Download the version as per your operating system from the above list. It downloads the zip file. Once the file downloads, unzip it and copy the .exe driver file to python folder.

We are copying the file to **C:\Python27\Scripts**.

C:\Python27\Scripts				
	Name	Date modified	Type	Size
	chromedriver	13-09-2018 11:58	Application	6,546 KB
	CreateBatchFiles	15-07-2011 21:30	Python File	2 KB
	CreateMacScripts	Date created: 08-10-2018 14:49 Size: 6.39 MB	Python File	2 KB
	easy_install	20-02-2011 21:30	Application	88 KB
	easy_install-2.7	06-10-2018 16:10	Application	88 KB
	editors	20-02-2009 12:22	File	1 KB

Now we are done installing the driver for chrome. We can get started with writing test case that will open browser and close browser.

Go back to ride and enter the keywords for opening the browser.

Ride helps you with keywords to be used with its built-in tool. Enter the command and press **ctrl+spacebar**. You will get all the details of the command as shown below:

1	Open			
2	Open Browser			overwrite the default profile Selenium uses. Notice that prior to Sele ^
3	Open Context Menu			the library contained its own profile that was used by default.
4				
5				
6				

Examples:

`Open Browser`	<a href="http://example.com">http://example.com</a>	Chrome	
`Open Browser`	<a href="http://example.com">http://example.com</a>	Firefox	alias=Firefox
`Open Browser`	<a href="http://example.com">http://example.com</a>	Edge	remote_url=http://127.0.

It gives the details of the command and also examples on how to use it. In the test case, we will open the site <https://www.tutorialspoint.com/> in chrome and the test case details will be as follows:

1	Open Browser	<a href="https://www.tutorialspoint.com/">https://www.tutorialspoint.com/</a>	chrome	
2				
3				
4				
5				
6				

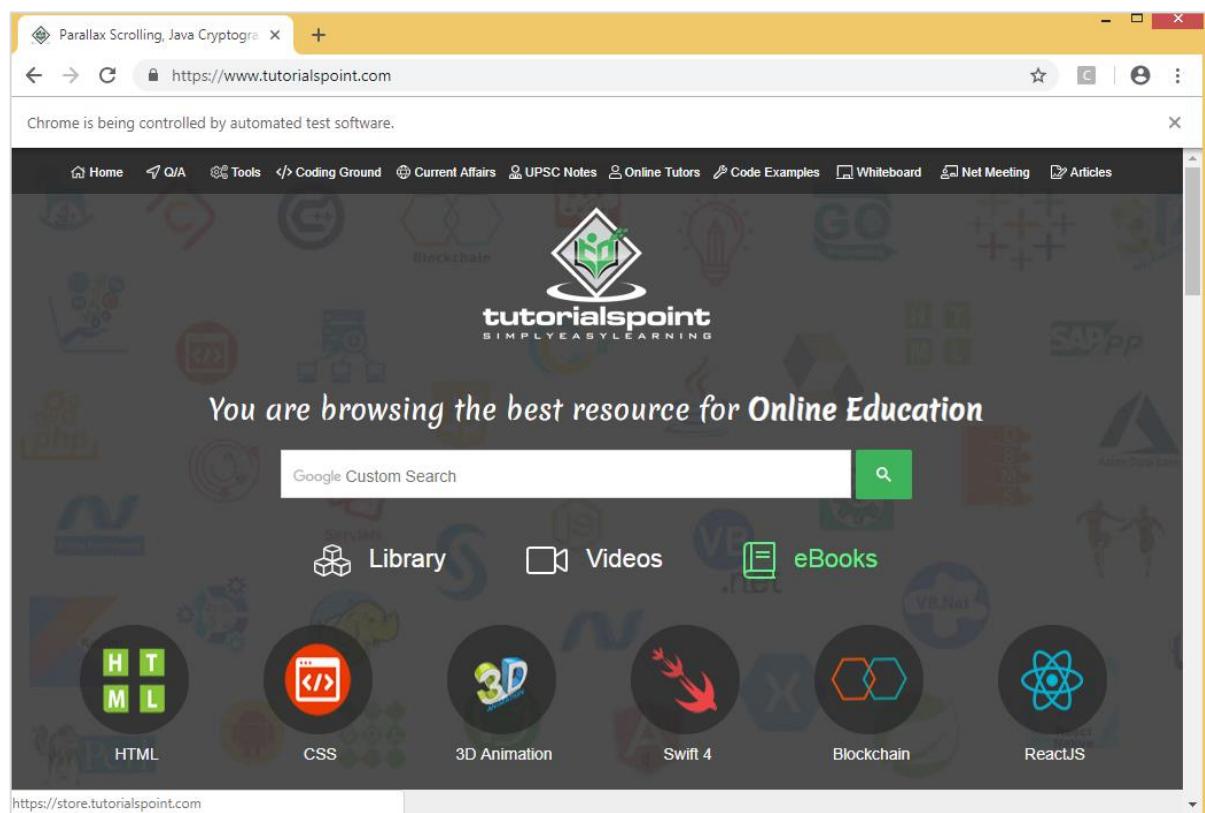

Let us now run this test case to see the output:

```

Edit | Text Edit | Run | 
Execution Profile: pybot | Report | Log | Autosave | Pause on failure | Show message log
Start | Stop | Pause | Continue | Next | Step over
Arguments: 
Only run tests with these tags | Skip tests with these tags

2				
3				
4				
5				
6				

## Conclusion

We have seen how to install Selenium library and the browser drivers to work with browsers in Robot framework. Using the selenium library keywords, we can open any given link in the browsers and interact with it. The details of the test-case execution are available in the form of reports and logs, which give the time taken for execution.

# 9. Robot Framework — Working With Textbox

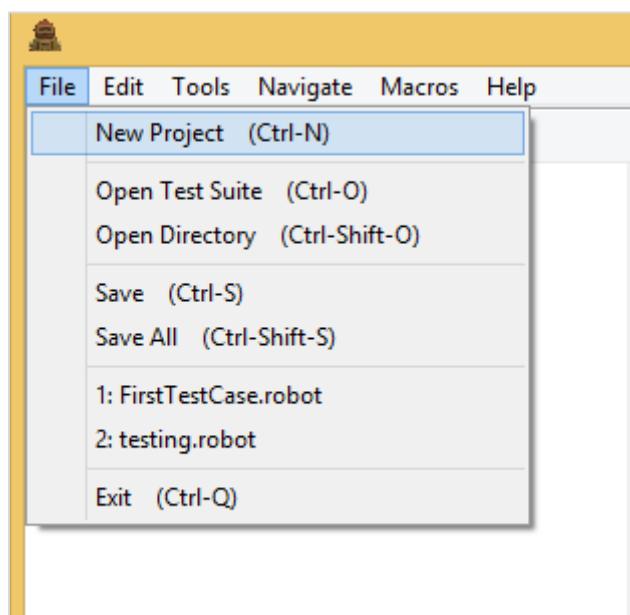

For testing, it becomes important to understand how to interact with the browser and locate the html elements. It is very easy to work with input fields with robot framework. In this chapter, we will learn how to work with textbox using Selenium Library. To work with input field – textbox, we need the locator, which is the main unique identifier for that textbox and it can be id, name, class, etc.

In this chapter, we will discuss the following areas:

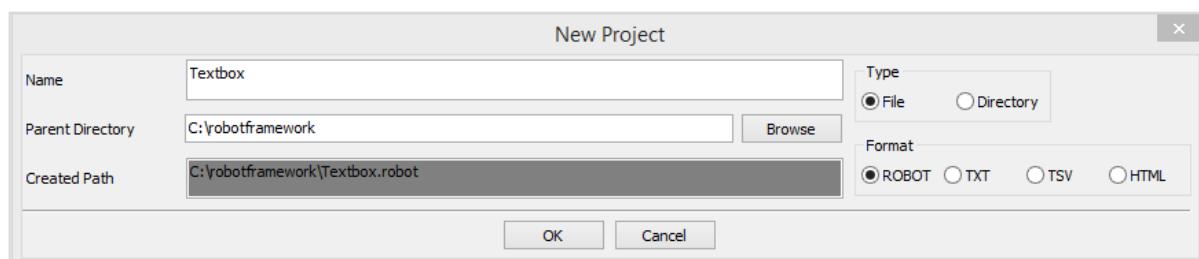

- Project Setup for Textbox Testing
- Enter Data in Search Textbox
- Click on Search Button

## Project Setup for Textbox Testing

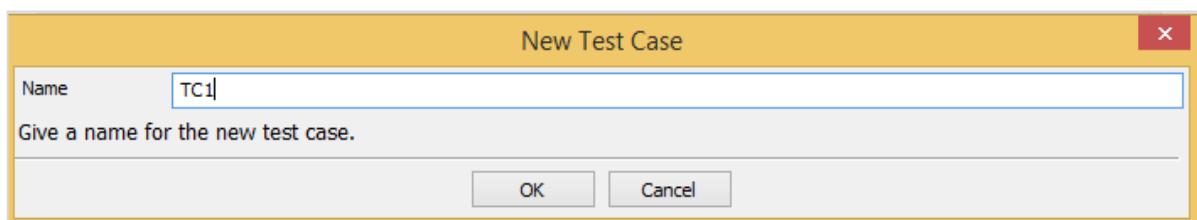

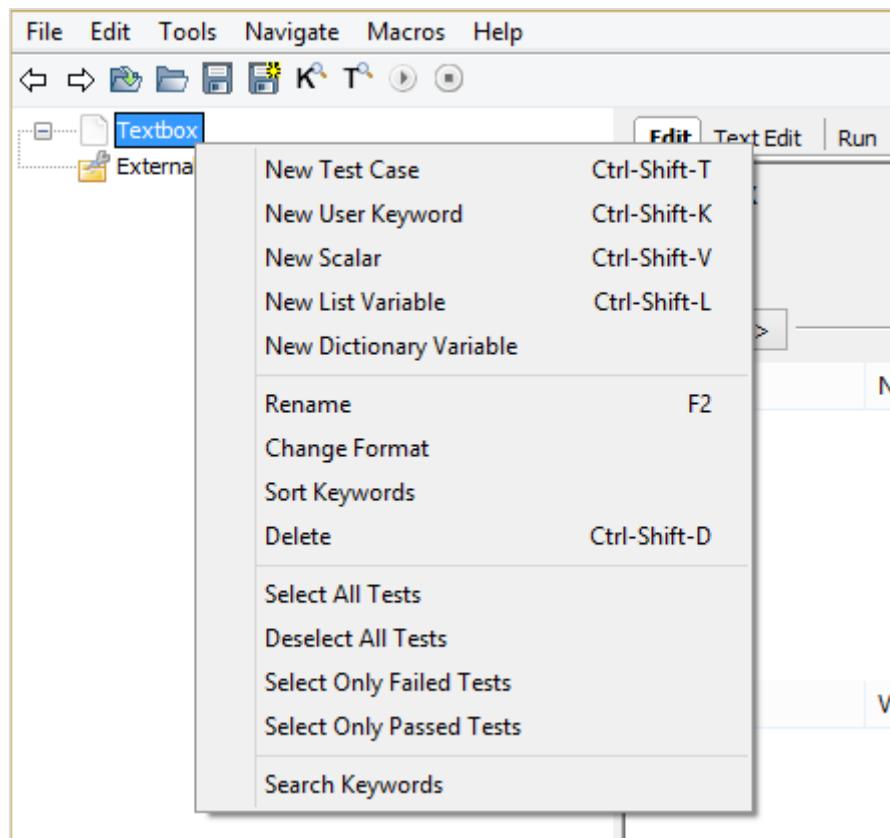

We will first create a project in Ride to work with browsers. Open ride using ride.py from the command line.

Click *New Project* and enter *Name* of your project as shown below.

The name given for the project is *Textbox*. Click OK to save the project. Right-click on the name of the project created and click on *New Test Case*:

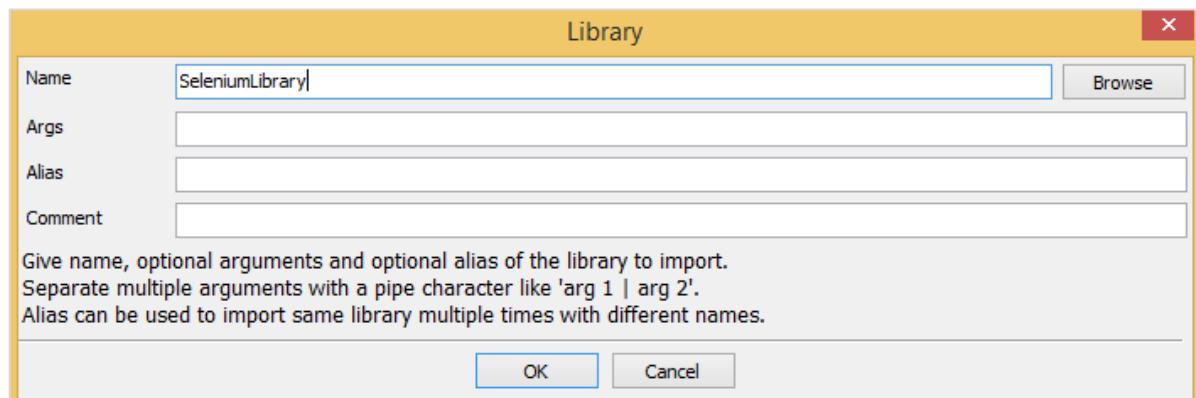

Name your test case and click OK to save it. We are now done with the project setup. Further, we will write test cases for the textbox. Since we need Selenium library, we need to import the same in our project.

Click on your project on the left side and use *Library* from Add Import.

The screenshot shows the Robot Framework interface with a project named 'Textbox'. The 'Source' field is set to 'C:\robotframework\Textbox.robot'. On the right, a context menu is open under 'Add Import' with options: Library (selected), Resource, Variables, and Import Failed Help. Below this, there are options for Add Scalar, Add List, and Add Dict. At the bottom, there is an 'Add Metadata' button.

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

The screenshot shows the 'BrowserTestCases' dialog box from the Robot Framework interface. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. Below the tabs, the title 'BrowserTestCases' is displayed. The 'Source' field contains the path 'C:\robotframework\BrowserTestCases.robot'. A 'Settings >>' button is located next to the source field. The main area contains three tables: 'Import', 'Variable', and 'Metadata'. In the 'Import' table, there is one row with 'Library' set to 'SeleniumLibrary'. On the right side of the dialog, there is a vertical sidebar with buttons for adding imports: 'Add Import' (highlighted), 'Library' (selected), 'Resource', 'Variables', 'Import Failed Help', 'Add Scalar', 'Add List', 'Add Dict', and 'Add Metadata'.

Import	Name / Path	Arguments	Comment	Add Import
Library	SeleniumLibrary			Library Resource Variables Import Failed Help Add Scalar Add List Add Dict

Variable	Value	Comment

Metadata	Value	Comment	Add Metadata
			Add Metadata

The name given has to match with the name of the folder installed in site-packages.

In case the names do not match, the library name will show in red as in the following screenshot:

The screenshot shows the 'BrowserTestCases' test case in the Robot Framework Test Case Editor. The 'Source' is set to 'C:\robotframework\BrowserTestCases.robot'. The 'Import' section contains two entries: 'Library' (SeleniumLibrary) and 'Library' (seleniumlibrary), where 'seleniumlibrary' is highlighted in red. To the right of the imports is a sidebar with buttons for 'Add Import' (Library, Resource, Variables, Import Failed Help), 'Add Scalar', 'Add List', 'Add Dict', and 'Add Metadata'.

## Enter Data in Textbox

We are now going to write test cases. The test case details will be as follows:

- Open browser: URL – <https://www.tutorialspoint.com/> in Chrome
- Enter data in the search textbox in <https://www.tutorialspoint.com/>
- Click Search

To work with textbox, we need a locator. A locator is the identifier for the textbox like id, name, class, etc. For example, if you are using the -

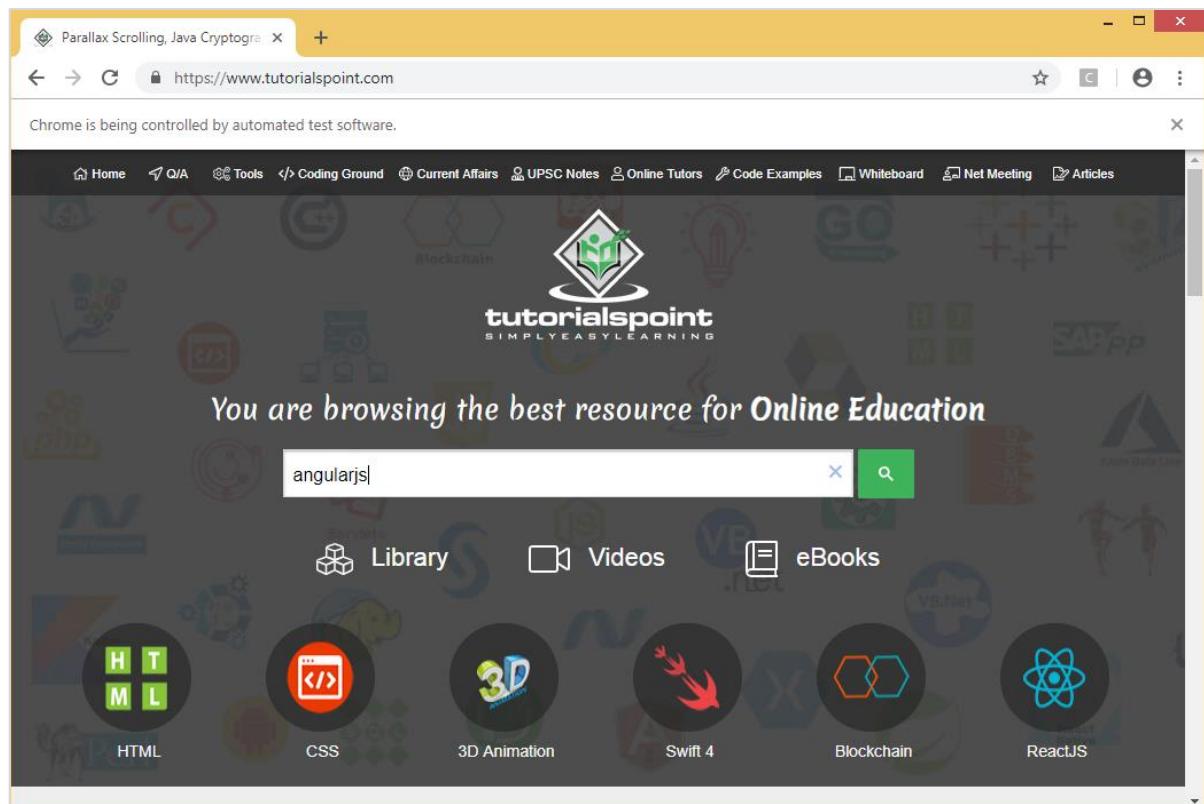

- **name** attribute of the textbox, it has to be `name:Nameofthetextbox` or `name=Nameofthetextbox`
- **id** of the textbox, it will be `id:idoftextbox` or `id=idoftextbox`
- **class** of the textbox, it will be `class:classfortextbox` or `class=classfortextbox`

Now, we will add the details of the test case for textbox in ride. Here are the keywords entered for textbox test case:

1	Open Browser	https://www.tutorialspoint.com/	chrome		
2	Input Text	name:search	angularjs		
3	Click Button	class:gsc-search-button-v2			
4					
5					

- **Open Browser:** The keyword opens the browser for the given URL and the browser specified.
- **Input Text:** This keyword works on the input type and will look for the locator name:search on the site <https://www.tutorialspoint.com/> and angularjs is the value we want to type in the textbox.
- **Click button** is used to click on the button with location class:gsc-search-button-v2.

We will now execute the same:

Upon clicking the Search icon, a screen will appear as shown in the following screenshot:

The screenshot shows a web browser window with the URL <https://www.tutorialspoint.com>. The page displays search results for the query "Parallax Scrolling, Java Cryptography". The results include:

## Conclusion

---

We have seen how to interact with the textbox using selenium library in robot framework. Using the keywords available with robot framework and the library imported we can locate the textbox and enter data and test the same.

# 10. Robot Framework — Working With Radio Button

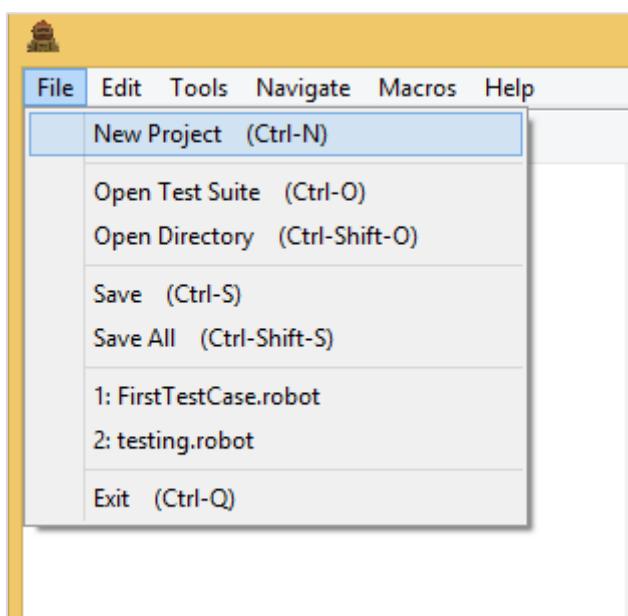

For testing, it becomes important to understand how to interact with the browser and locate the html elements. It is very easy to work with input fields with robot framework. In this chapter, we will learn how to work with radio button using Selenium Library. To work with radio button, we need the locator – the main unique identifier for that radio button.

We are going to discuss the following over here:

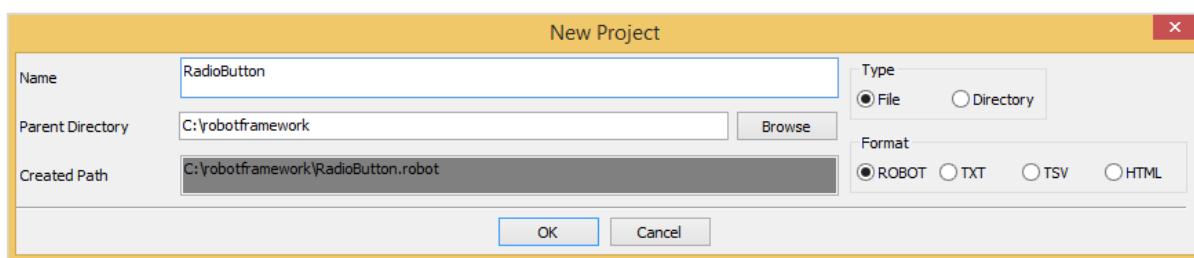

- Project Setup for Radio Button Testing
- Test case for Radio Button

## Project Setup For Textbox Testing

We will first create a project in Ride to work with browsers. Open ride using ride.py from the command line.

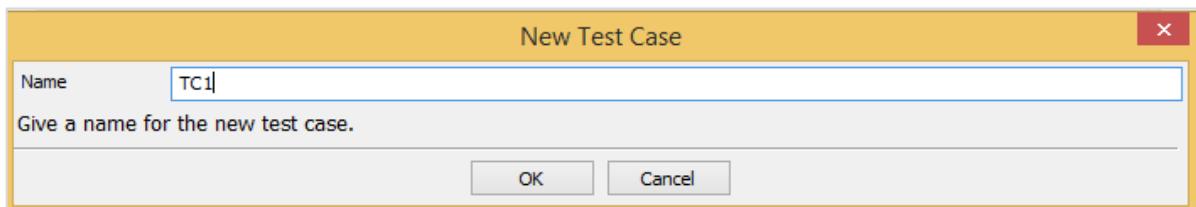

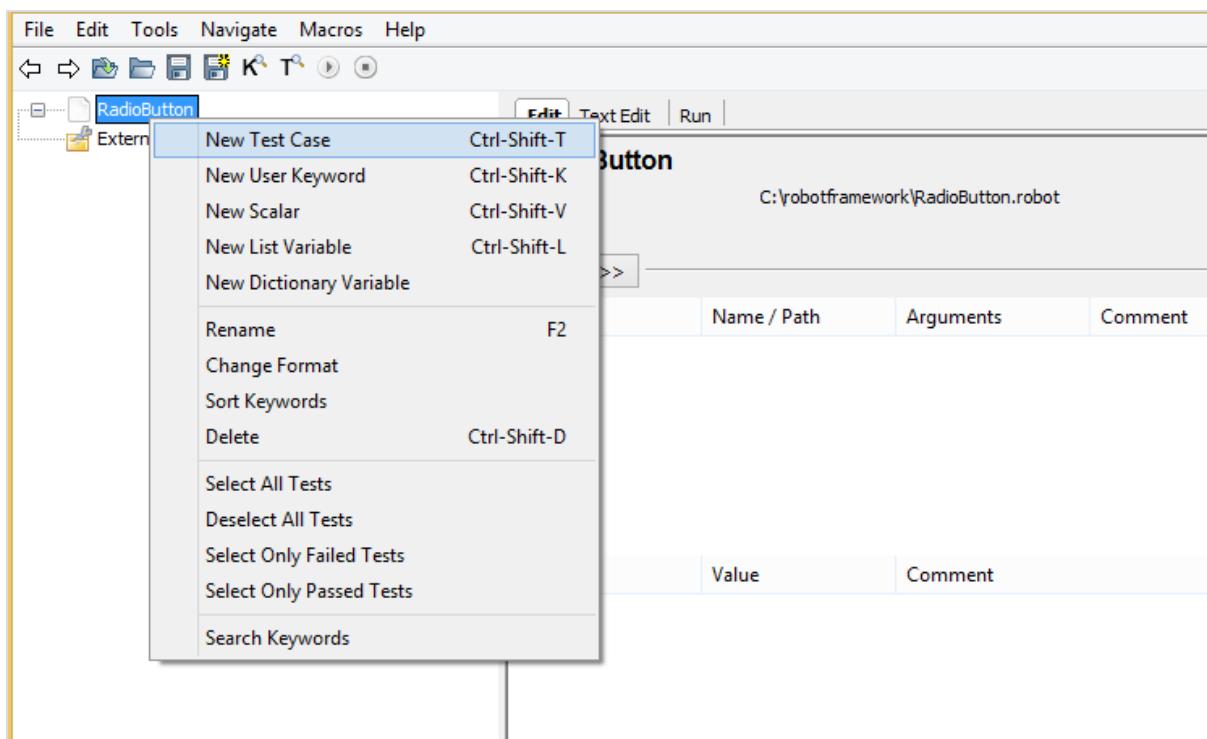

Click *New Project* and enter *Name* of your project as shown in the screenshot below.

The name given is RadioButton. Click on *OK* button to save the project.

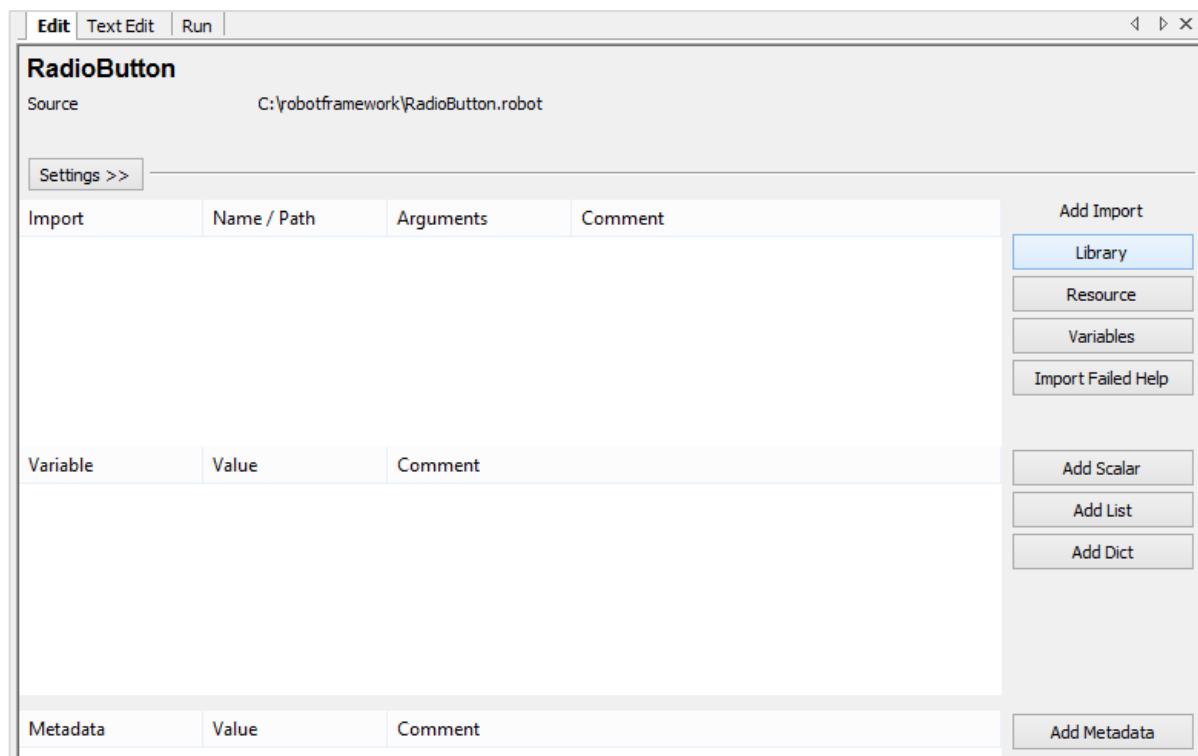

Right-click on the name of the project created and click on *New Test Case*:

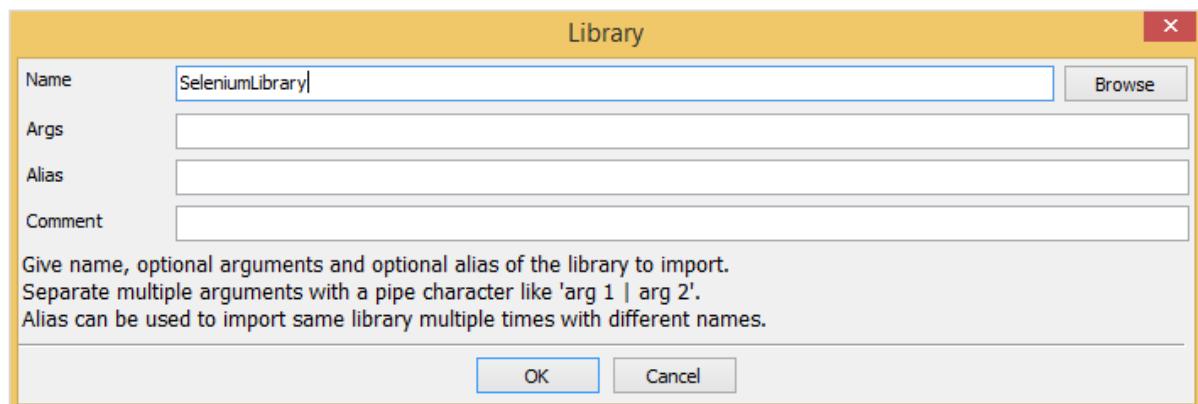

Give name to the test case and click OK to save it. We are done with the project setup and now will write test cases for the radio button. Since we need Selenium library, we need to import the same in our project.

Click on your project on the left side and use *Library* from *Add Import*.

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will be displayed in the settings.

The screenshot shows the Robot Framework Test Case Editor interface. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. Below the tabs, the title 'RadioButton' is displayed. The 'Source' field contains the path 'C:\robotframework\RadioButton.robot'. A 'Settings >>' button is present. On the right side, there is a vertical toolbar with buttons for 'Add Import' (highlighted), 'Library', 'Resource', 'Variables', 'Import Failed Help', 'Add Scalar', 'Add List', 'Add Dict', and 'Add Metadata'. The main area contains three tables: 'Import', 'Variable', and 'Metadata', each with columns for 'Name / Path', 'Arguments', 'Comment', and 'Value'. In the 'Import' table, 'Library' is set to 'SeleniumLibrary'. The 'Variable' and 'Metadata' tables are currently empty.

The name given has to match with the name of the folder installed in site-packages. If the name does not match, it will be in red as shown below:

The screenshot shows the Robot Framework Test Case Editor interface. At the top, there are tabs for 'Edit', 'TextEdit', and 'Run'. Below the tabs, the title 'RadioButton' is displayed. Under 'Source', the path 'C:\robotframework\RadioButton.robot' is shown. A 'Settings >>' button is present. On the right side, there is a sidebar with buttons for managing imports: 'Add Import' (Library is selected), 'Resource', 'Variables', and 'Import Failed Help'. Below the imports, there are buttons for managing variables: 'Add Scalar', 'Add List', and 'Add Dict'. At the bottom, there is a 'Metadata' section with a 'Add Metadata' button.

## Test Case for Radio Button

The radio button test case will select a radio button, with the help of a locator.

Consider the following html display for radio button:

```
<input type="radio" name="gender" value="male" checked> Male<br/>
<input type="radio" name="gender" value="female"> Female<br/>
```

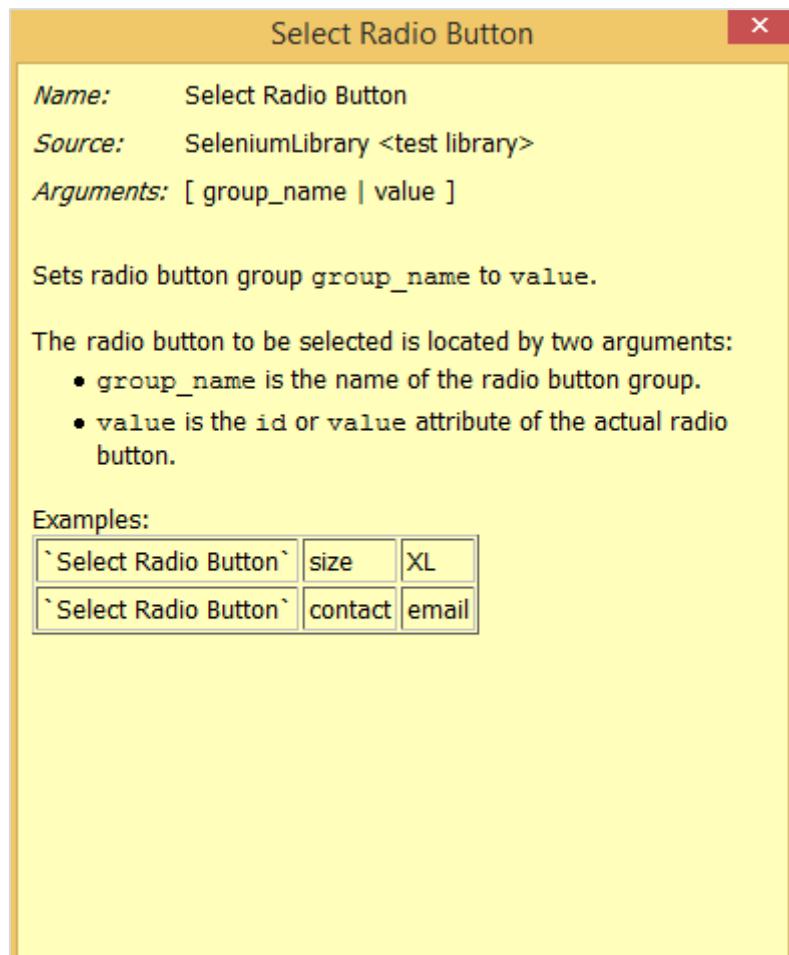

For radio button, *name* is the locator. In the above example, the *name* is *gender*. We also need the value so that we can select the radio button we want. The values in the above example are *Male* and *Female*.

Now, we will create a test-page with radio button and open the same in the browser. Now, select the value of the radio button. The test case details will be as follows:

- Open browser: URL – <http://localhost/robotframework/radiobutton.html> in chrome
- Enter details of radio button

- Execute the test case

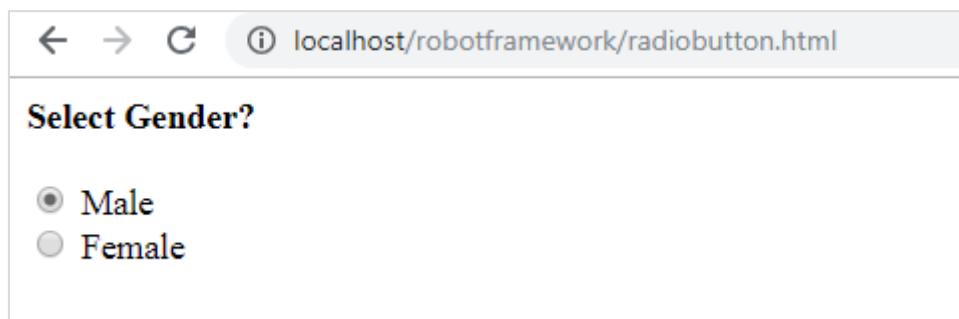

While writing the keyword for test cases, press Ctrl + Spacebar. You will get the details of the command. Details of Radio button:

For the radio button, the arguments are group name and value. Here are the details of the test case for Radio button selection:

1	Open Browser	http://localhost/robotframework/rz/chrome	
2	Select Radio Button	gender	female
3			
4			
5			
6			
7			

Following is the Test Page for radio button:

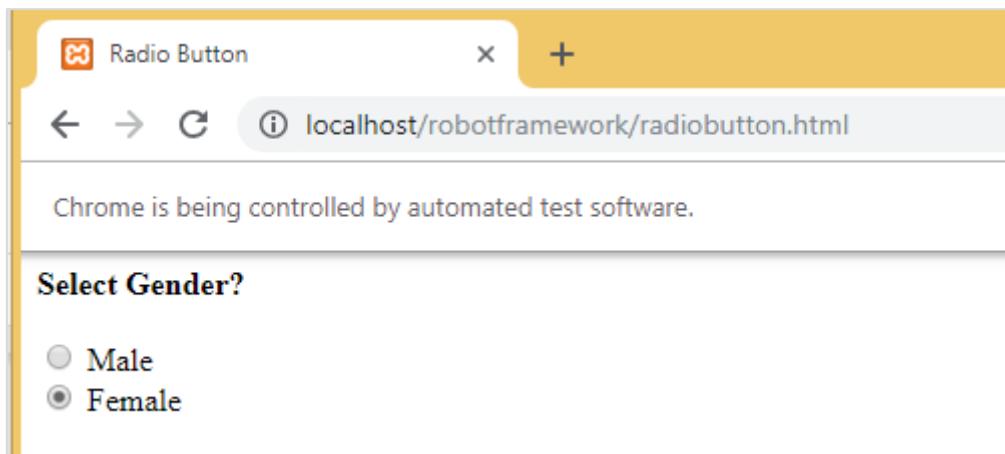

The screenshot shows a web browser window with the URL `localhost/robotframework/radiobutton.html`. The page title is "Select Gender?". It contains two radio buttons: "Male" (selected) and "Female".

Html code for Radiobutton.html

```
<html>
<head>
<title>Radio Button</title>
</head>
<body>
<form name="myform" method="POST">
<b>Select Gender?</b>
<div><br/>
<input type="radio" name="gender" value="male" checked> Male<br/>
<input type="radio" name="gender" value="female"> Female<br/>
</div>
</form>
</body>
</html>
```

In the above form, we are planning to select *female*, which is a radio button. The name and value are given in the test case. Now, we will execute the test case and check the selection of the checkbox for the above form.

Let us execute the test case and see the display in the browser:

When the test case is executed, it opens the URL <http://localhost/robotframework/radiobutton.html> and selects the *Female* radio button whose name and value we have given in the test case.

Here are the execution details in Ride:

```

Edit Text Edit Run

## Conclusion

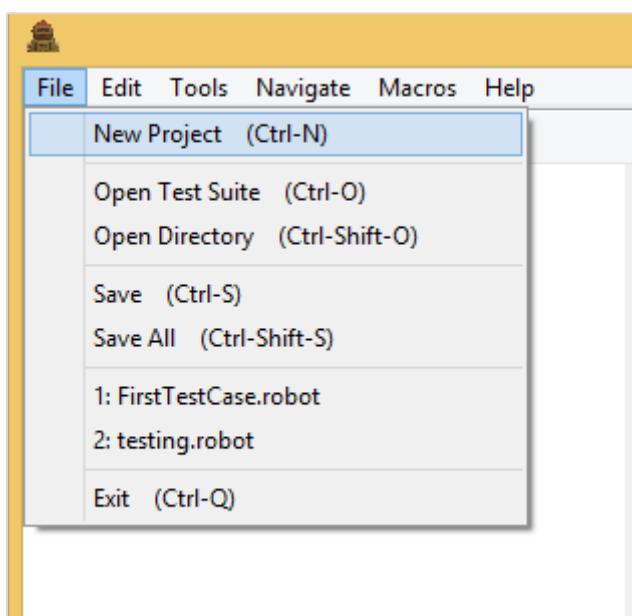

We have seen how to select value of radio button by giving the group name of the radio button to the test case. Using the keywords available with robot framework and the library imported, we can locate the radio button and select the value of the radio button. We do get the details of the test-case executed using robot framework logs and report.

# 11. Robot Framework — Working With Checkbox

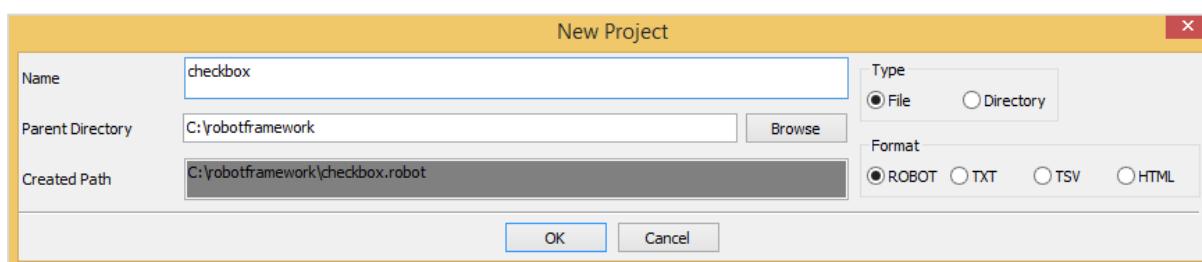

For testing, it becomes important to understand how to interact with the browser and locate the html elements. It is very easy to work with input fields with robot framework. In this chapter, we will learn how to work with checkbox using Selenium Library. To work with checkbox, we need the locator, which is the main unique identifier for that checkbox. The locator can be id, name, class, etc.

## Project Setup for Checkbox Testing

We will first create a project in Ride to work with browsers. Open ride using **ride.py** from the command line.

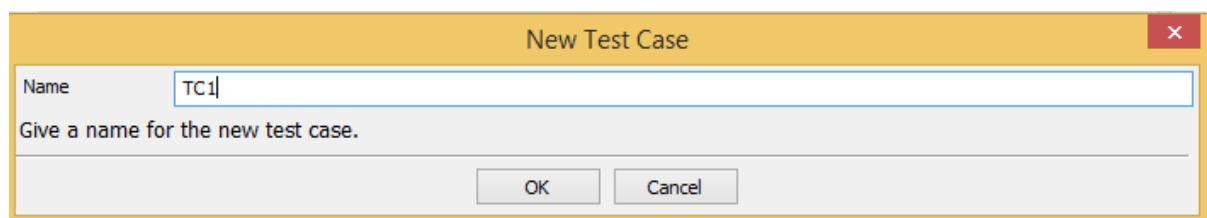

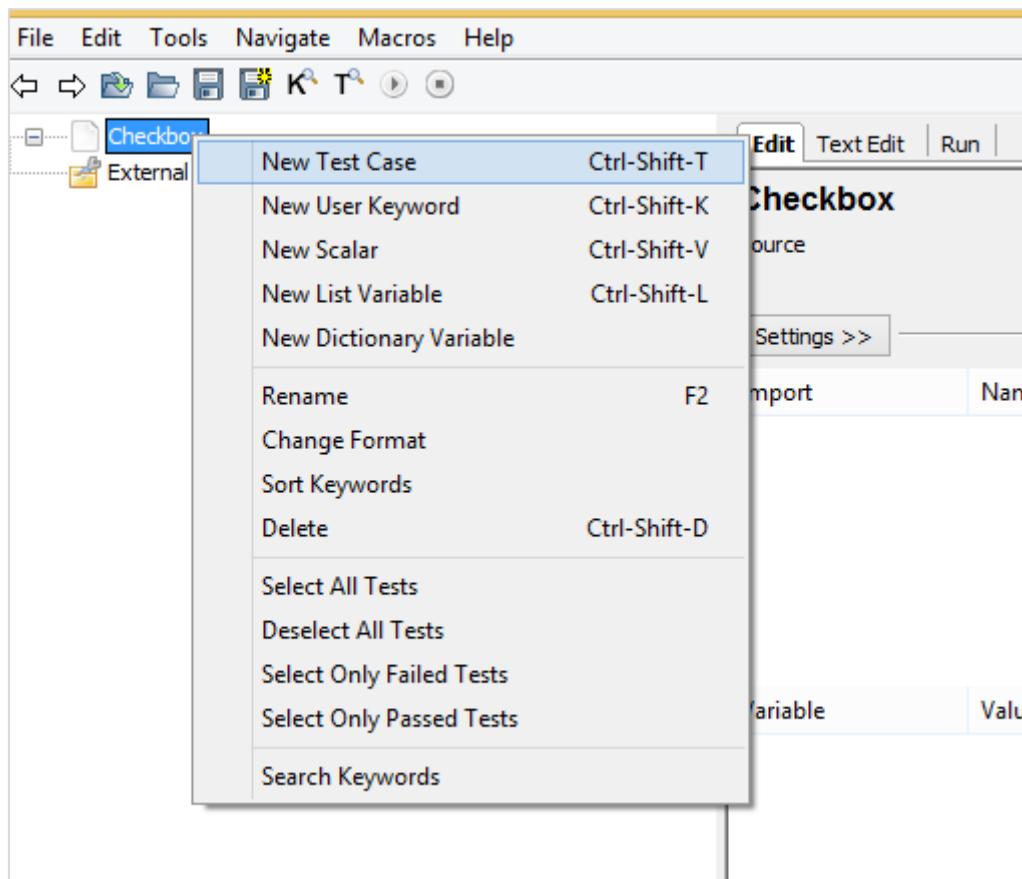

Click on *New Project* and enter *Name* of your project as shown in the screenshot below.

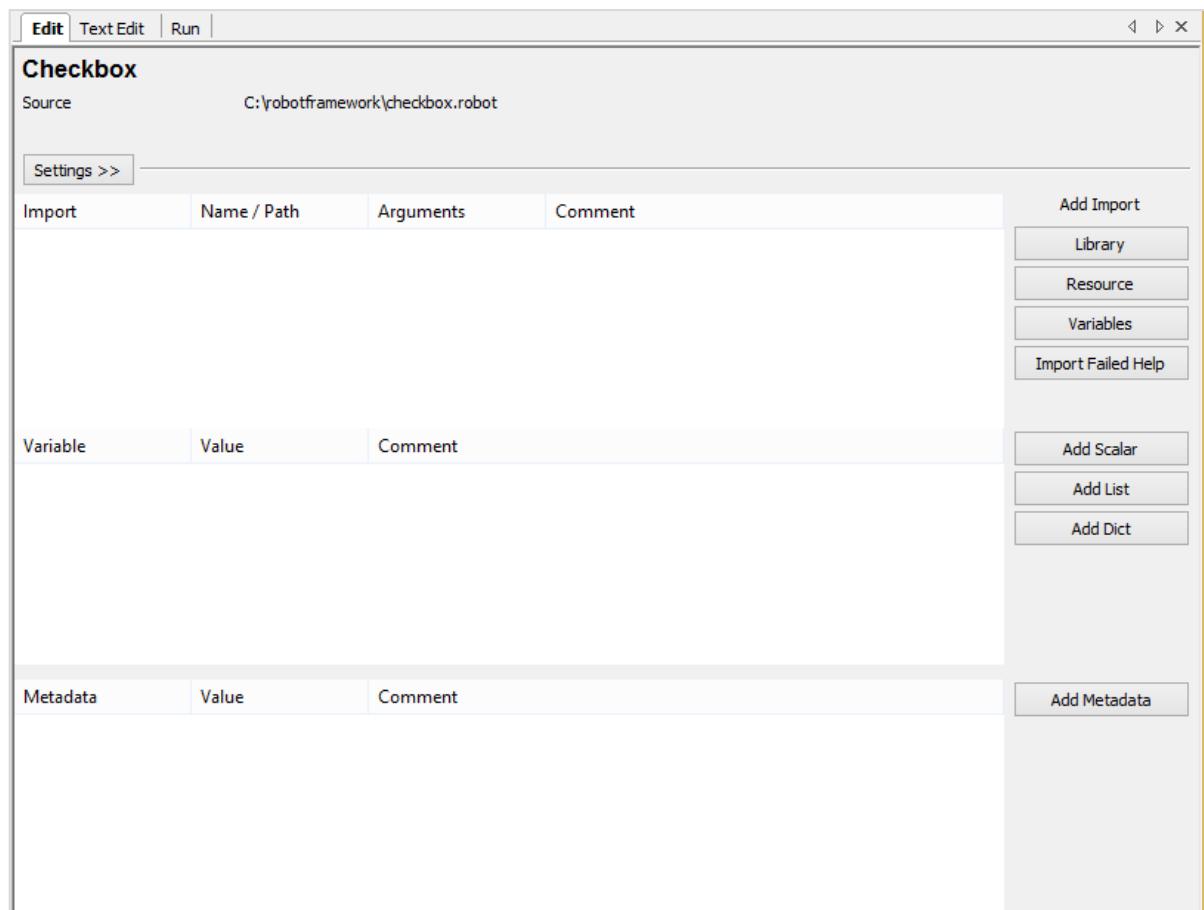

The name given for the project is *Checkbox*. Click OK to save the project.

Right-click on the name of the project created and click *New Test Case*:

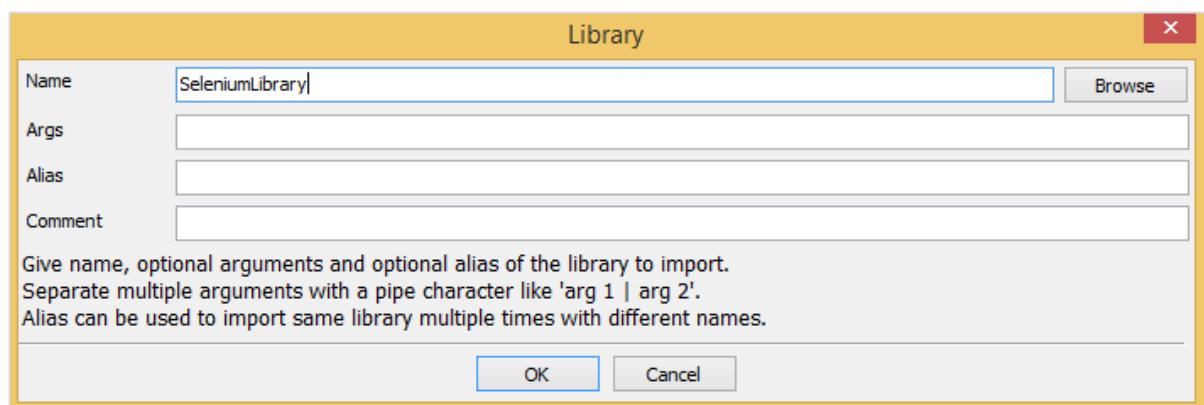

Give name to the test case and click OK. We are done with the project setup. Now we will write test cases for checkbox. Since we need Selenium library, we need to import the same in our project.

Click on your project on the left side and use *Library* from *Add Import*.

Now, click Library. A screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

Edit Text Edit Run

### Checkbox

- Variables
- Import Failed Help

Variable

Value	Comment

Add Scalar

Metadata

Value	Comment

Add Metadata

The name given has to match with the name of the folder installed in site-packages. If the names do not match, the library name will show in red:

## Test Case for Checkbox

In the test case, we will select the checkbox. To select the checkbox, we need the identifier locator.

Now consider the following html display for checkbox:

```
<input type="checkbox" name="option1" value="Car"> Car
```

For checkbox, we have the *name* as the locator. In the above example, the *name* is *option1*. We also need the value so that we can select the same. **Car** holds the value in the above example.

Now, we will create a test page with checkbox. Open the checkbox in the browser and select the value.

The test case details will be as follows:

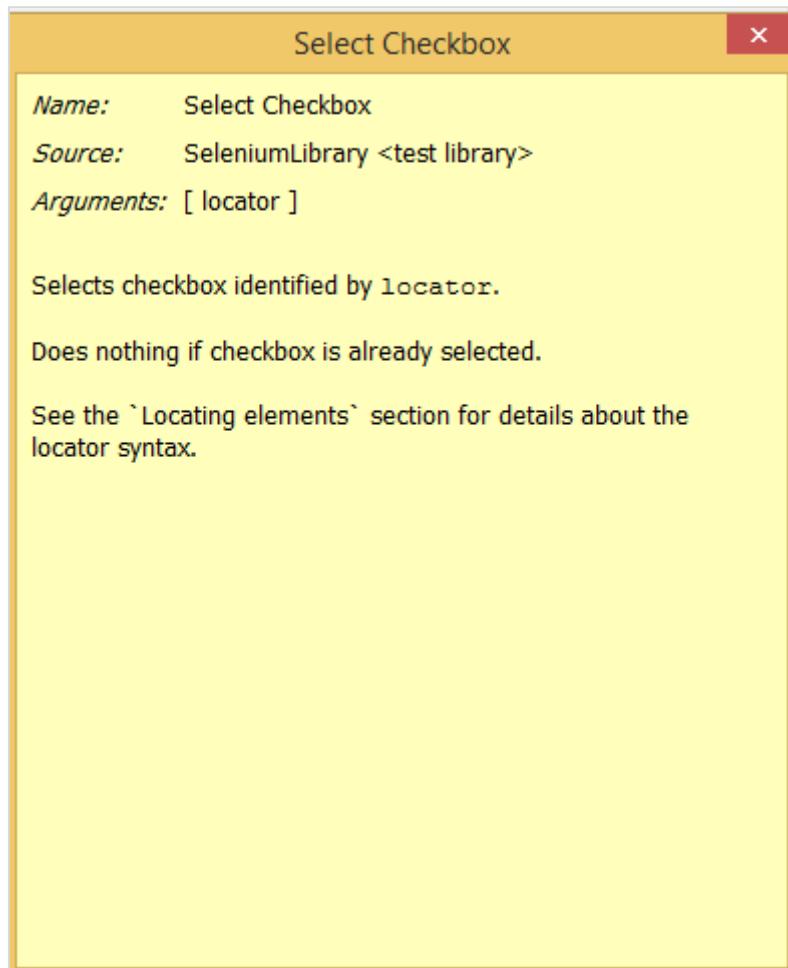

- Open browser: URL – <http://localhost/robotframework/checkbox.html> in Chrome
- Enter details of checkbox.
- Execute the test case.

While writing the keyword for test cases, press Ctrl + Spacebar. It gives all the details of the command. Details of checkbox.

The keywords to be used for checkbox is:

```
Select checkbox name:nameofcheckbox value
```

The command details from ride is as follows:

So, arguments is the locator for the checkbox. Here are the details of the test case for Checkbox selection:

1	Open Browser	http://localhost/robotframework/d/chrome		
2	Select Checkbox	name:option1		
3				
4				
5				
6				
7				

This is how the URL is:

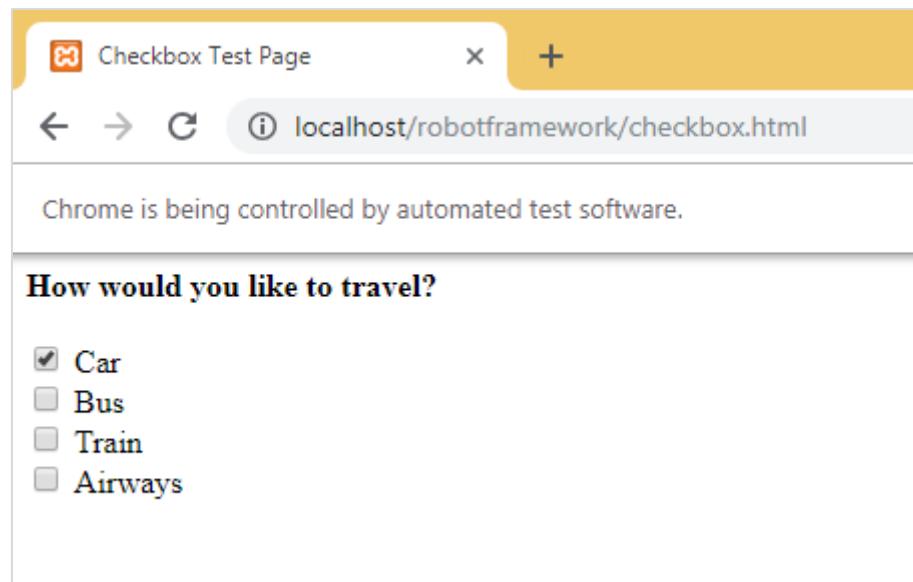

The screenshot shows a web browser window with the URL `localhost/robotframework/checkbox.html`. The page title is "How would you like to travel?". Below the title is a list of four options, each preceded by a checkbox:

- Car
- Bus
- Train
- Airways

## checkbox.html

```
<html>
<head>
<title>Checkbox Test Page</title>
</head>
<body>
<form name="myform" method="POST">
<b>How would you like to travel?</b>
<div><br>
<input type="checkbox" name="option1" value="Car"> Car<br>
<input type="checkbox" name="option2" value="Bus"> Bus<br>
<input type="checkbox" name="option3" value="Train"> Train<br>
<input type="checkbox" name="option4" value="Air"> Airways<br>
<br>
</div>
</form>
</body>
</html>
```

In the above form, we are planning to select *Car*, which is a checkbox. The details are given in the test case. Now, we will execute the test case and check the selection of the checkbox for the above form.

When the test case is executed, it opens the URL <http://localhost/robotframework/checkbox.html> and selects the name Car given in the test case.

Here are the execution details:

```

Edit Text Edit Run
Execution Profile: pybot Report Log Autosave Pause on failure Show message log
Start Stop Pause Continue Next Step over
Arguments: Only run tests with these tags Skip tests with these tags
elapsed time: 0:00:07 pass: 0 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEEniruis.d\argfile.txt --listener C

## Conclusion

---

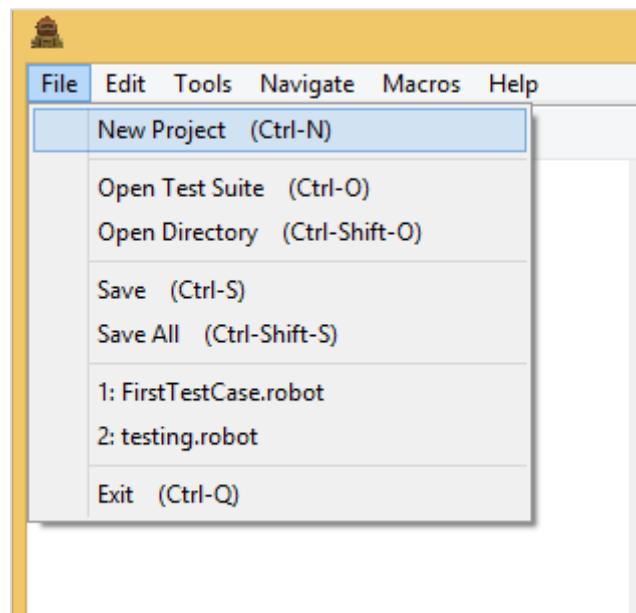

In this chapter, we learnt how we can select a checkbox by giving the locator of the checkbox. The log and Reports give the details of the execution of the test case along with the time spent for each test case.

# 12. Robot Framework — Working With Dropdown

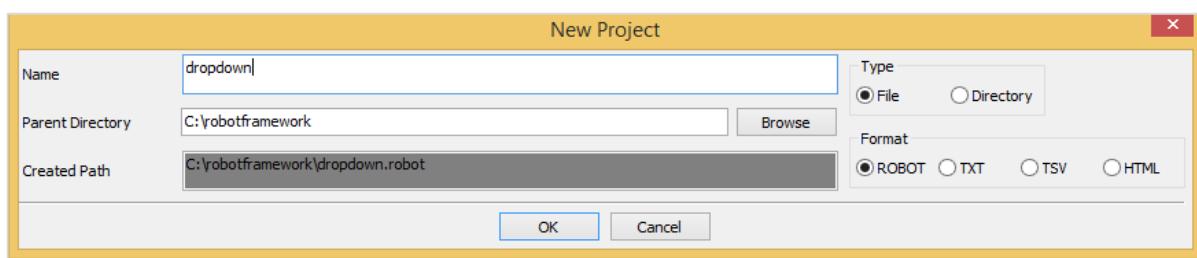

In this chapter, we will learn how to work with dropdown using Selenium Library.

## Project Setup for Dropdown Testing

We will first create a project in Ride to work with browsers. Open ride using **ride.py** from the command line:

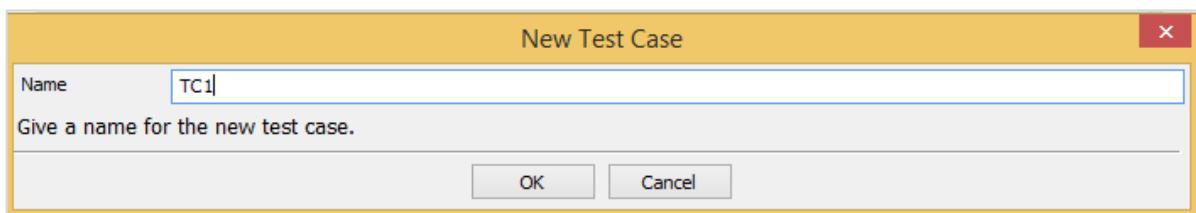

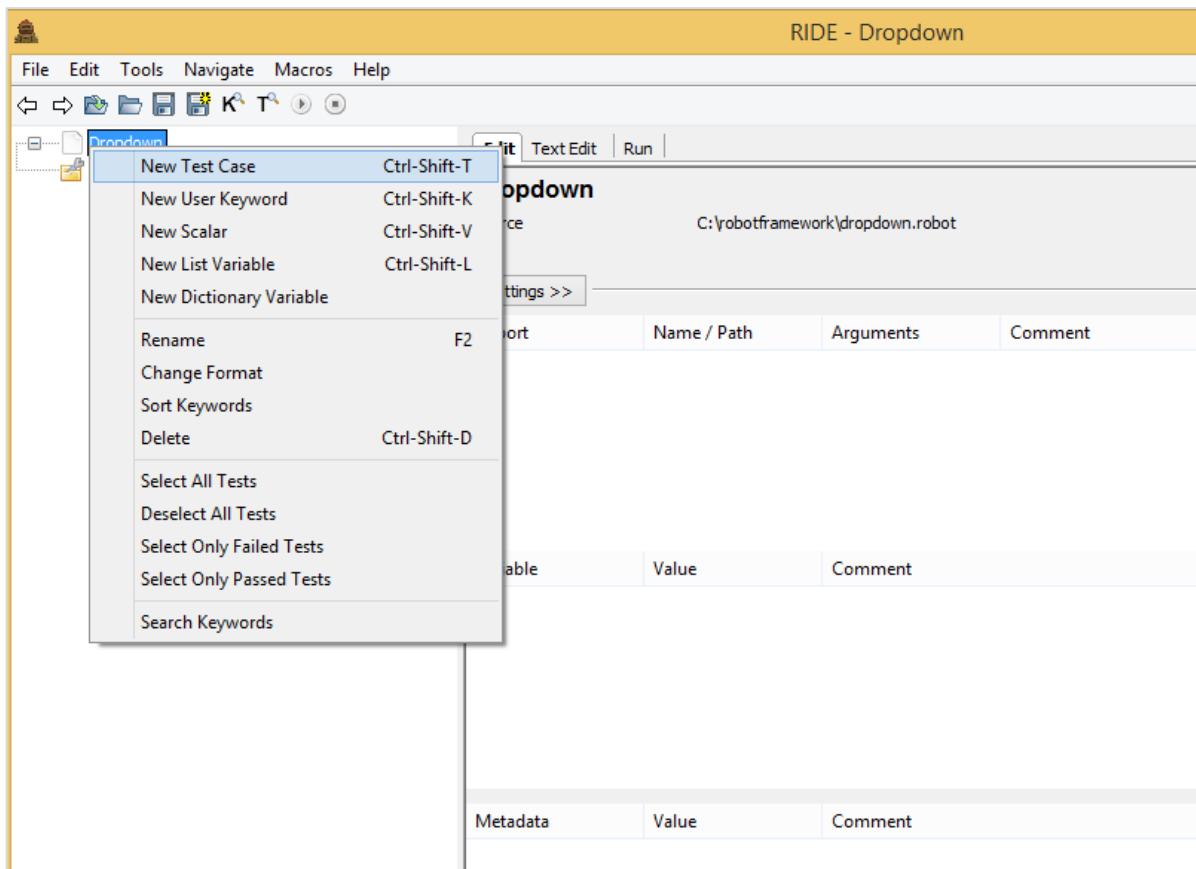

Click *New Project* and give a name to your project.

The name given is dropdown. Click OK to save the project.

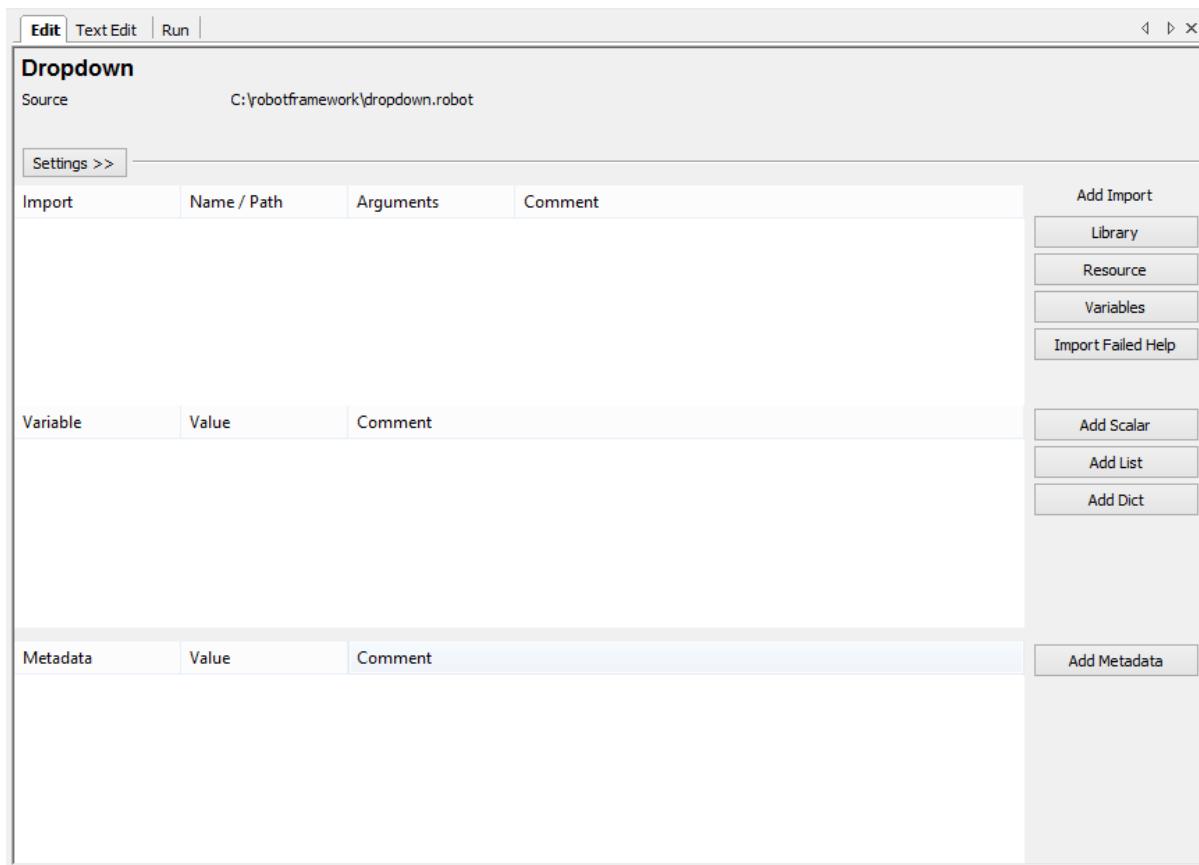

Right-click on the name of the project created and click *New Test Case*:

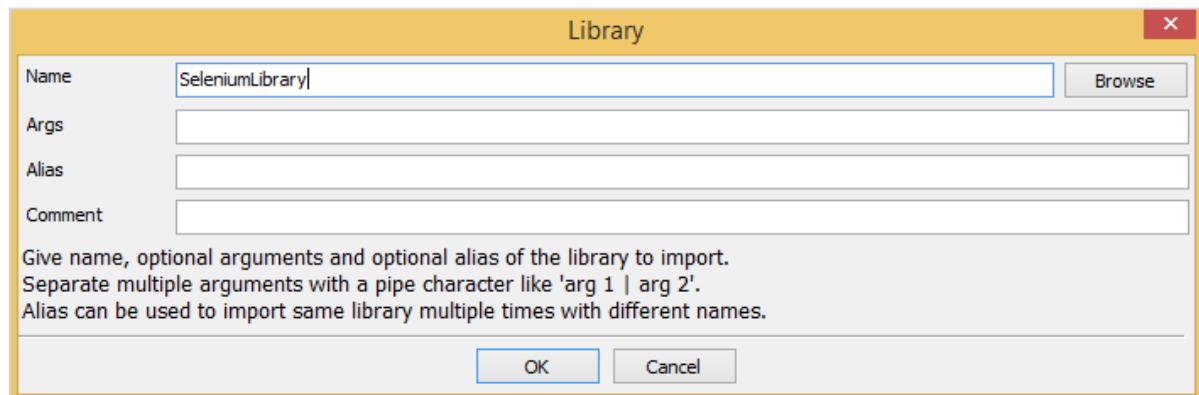

Give name to the test case and click OK to save it.

We are done with the project setup. Now, we will write test cases for the dropdown. Since we need Selenium library, we need to import the same in our project.

Click on your project on the left side and use *Library* from *Add Import* as shown below:

Now, click *Library*. A screen will appear where you need to enter the library name:

Click *OK* and the library will be displayed in the settings.

The screenshot shows the Robot Framework Test Case Editor interface. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. The title bar says 'Dropdown'. Below the title bar, the source file is listed as 'C:\robotframework\dropdown.robot'. A 'Settings >>' button is visible. The main area contains three tables: 'Import', 'Variable', and 'Metadata'. In the 'Import' table, 'Library' is set to 'SeleniumLibrary'. The 'Variable' and 'Metadata' tables are currently empty. On the right side of the editor, there is a context menu with the following options:

- Add Import
  - Library
  - Resource
  - Variables
  - Import Failed Help
- Add Scalar
- Add List
- Add Dict
- Add Metadata

The name given has to match with the name of the folder installed in site-packages.

In case the name does not match, the library name will show in red:

Library import in red is as good as the library does not exists inside python. So now we are done with selenium library import.

## Test Case for Dropdown

The test case for dropdown will select the value from the dropdown. To go about working with this, we need the locator (identifier) for that dropdown.

Consider the following html display for dropdown:

```
<select name="carbrand">
<option value="">Select car brand..</option>
<option value="audi">AUDI</option>
<option value="bmw">BMW</option>
<option value="chevrolet">CHEVROLET</option>
<option value="datsun">DATSUN</option>
</select>
```

For dropdown, *name* is the *locator*. In the above example, the *name* is *carbrand*. We also need the value so that we can select the same. The values in the above example are – *audi*, *bmw*, *chevrolet* and *datsun*.

Now, we will create a test page with dropdown, open the same in the browser and select the value from the dropdown.

The test case details will be as follows:

- Open browser: URL – <http://localhost/robotframework/dropdown.html> in chrome
- Enter details of dropdown
- Execute the test case

While writing the keyword for test cases in RIDE, press Ctrl + Spacebar. This gives all the details of the command.

For dropdown, we have three ways of doing it:

- Select From List By Index
- Select From List By Label
- Select From List By Value

We will work on an example to show working for all the cases mentioned above.

In our test page, we will create 3 dropdowns and will use above test cases to select the dropdown by index, label and value.

## **dropdown.html**

```
<html>
<head>
<title>Dropdown</title>
</head>
<body>
<form name="myform" method="POST">
<div>
Dropdown By Index:
<select name="months">
<option value="">Select Months.</option>
<option value="Jan">January</option>
<option value="Feb">February</option>
<option value="Mar">March</option>
<option value="Apr">April</option>
<option value="May">May</option>
<option value="Jun">June</option>
<option value="Jul">July</option>
```

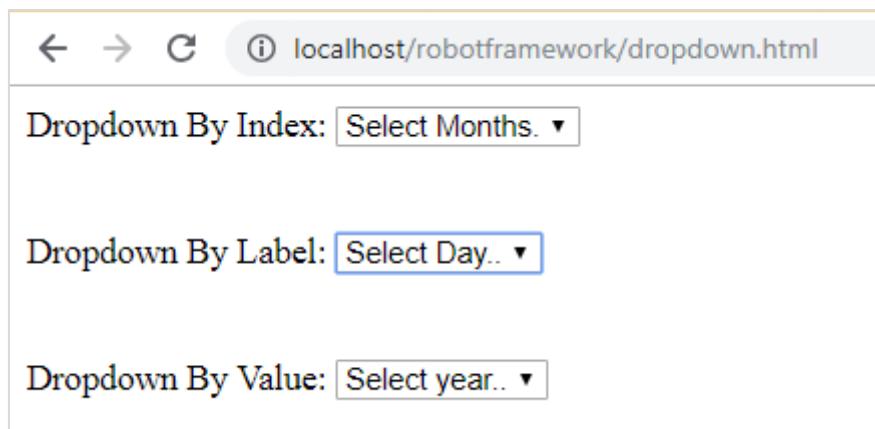

```
<option value="Aug">August</option>
<option value="Sept">September</option>
<option value="Oct">October</option>
<option value="Nov">November</option>
<option value="Dec">December</option>
</select>
</div>
<br/>
<br/>
<div>
Dropdown By Label:
<select name="days">
<option value="">Select Day..</option>
<option value="01">01</option>
<option value="02">02</option>
<option value="03">03</option>
<option value="04">04</option>
<option value="05">05</option>
<option value="06">06</option>
<option value="07">07</option>
<option value="08">08</option>
<option value="09">09</option>
<option value="10">10</option>
<option value="11">11</option>
<option value="12">12</option>
<option value="13">13</option>
<option value="14">14</option>
<option value="15">15</option>
<option value="16">16</option>
<option value="17">17</option>
<option value="18">18</option>
<option value="19">19</option>
<option value="20">20</option>
<option value="21">21</option>
<option value="22">22</option>
<option value="23">23</option>
<option value="24">24</option>
```

```
<option value="25">25</option>
<option value="26">26</option>
<option value="27">27</option>
<option value="28">28</option>
<option value="29">29</option>
<option value="30">30</option>
<option value="31">31</option>
</select>
</div>
<br/>
<br/>
<div>

Dropdown By Value:

<select name="year">
<option value="">Select year..</option>
<option value="0">2000</option>
<option value="1">2001</option>
<option value="2">2002</option>
<option value="3">2003</option>
<option value="4">2004</option>
<option value="5">2005</option>
<option value="6">2006</option>
<option value="7">2007</option>
<option value="8">2008</option>
<option value="9">2009</option>
<option value="10">2010</option>
<option value="11">2011</option>
<option value="12">2012</option>
<option value="13">2013</option>
<option value="14">2014</option>
<option value="15">2015</option>
<option value="16">2016</option>
<option value="17">2017</option>
<option value="18">2018</option>
</select>
</div>
</form>
```

```
</body>
</html>
```

We will add test cases for all 3 dropdown selection in Ride.

For index, we need to pass the locator of that dropdown – *name* or *id* and the *index* of the element that needs to be selected.

## Select List by Index – Example

```
<select name="months">
<option value="">Select Months.</option> // index 0
<option value="Jan">January</option> //index 1
<option value="Feb">February</option> // index 2
<option value="Mar">March</option> // index 3
<option value="Apr">April</option> // index 4
<option value="May">May</option> // index 5
<option value="Jun">June</option> // index 6
<option value="Jul">July</option> // index 7
<option value="Aug">August</option> // index 8
<option value="Sept">September</option> //index 9
<option value="Oct">October</option> //index 10
<option value="Nov">November</option> //index 11
<option value="Dec">December</option> // index 12
</select>
```

Now, we want to select month as May so the index to be given in the test case is 5.

## Select List by Label – Example

Label is seen when you open the dropdown on screen.

Dropdown By Index: Select Months. ▾

Dropdown By Label: 08 ▾  
Select Day..  
01  
**02**  
03  
04  
05  
06  
07  
08  
09  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19

Dropdown By Value:

If you want to select a day, you can choose one from the dropdown.

### Select From List by Value

Here is the list of the year. The list has values from 0 to 18.

```
<select name="year">
<option value="">Select year..</option>
<option value="0">2000</option>
<option value="1">2001</option>
<option value="2">2002</option>
<option value="3">2003</option>
<option value="4">2004</option>
<option value="5">2005</option>
<option value="6">2006</option>
<option value="7">2007</option>
<option value="8">2008</option>
<option value="9">2009</option>
<option value="10">2010</option>
<option value="11">2011</option>
```

```

<option value="12">2012</option>
<option value="13">2013</option>
<option value="14">2014</option>
<option value="15">2015</option>
<option value="16">2016</option>
<option value="17">2017</option>
<option value="18">2018</option>
</select>

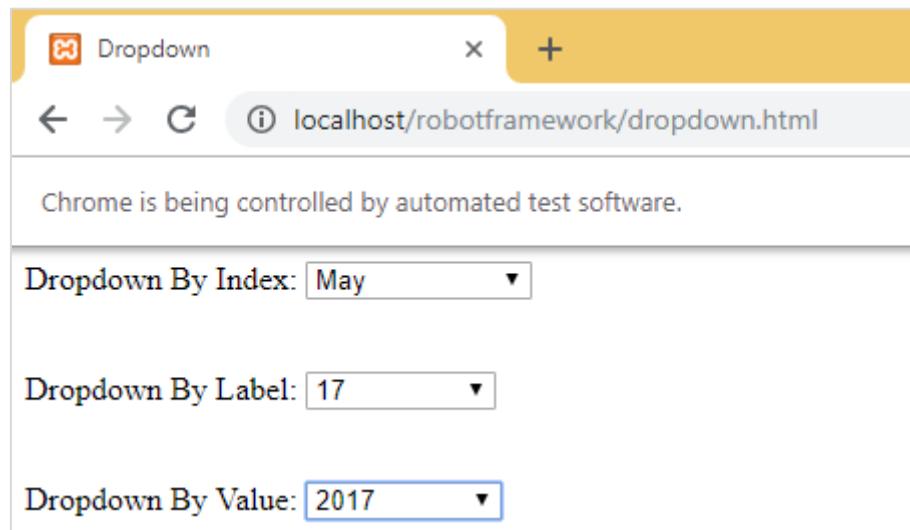

```

If you want to select any year, take the value corresponding to the year and add the same in test case. For example, if you want to select year 2017 the value is 17.

Here is the final list of test cases:

1	<b>Open Browser</b>	http://localhost/robotframework/d	chrome		
2	<b>Select From List By Index</b>	name:months	5		
3	<b>Select From List By Label</b>	name:days	17		
4	<b>Select From List By Value</b>	name:year	17		
5					
6					
7					

After execution, here is the selection done for dropdowns based on the test case:

## Execution Details

The screenshot shows the Robot Framework Test Runner window. The 'Run' tab is selected. In the 'Arguments' section, there is a checkbox for 'Only run tests with these tags' which is unchecked. Below the arguments, the test log output is displayed:

```

elapsed time: 0:00:08 pass: 0 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDE5y_mcs.d\argfile.txt --listener C
=====
Dropdown
=====
TC1 | PASS |
=====
Dropdown | PASS |
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDE5y_mcs.d\output.xml
Log:   c:\users\appdata\local\temp\RIDE5y_mcs.d\log.html
Report: c:\users\appdata\local\temp\RIDE5y_mcs.d\report.html
test finished 20181014 15:15:13

```

## Report Details

The screenshot shows the 'Dropdown Test Report' generated by Robot Framework. The report includes the following sections:

- Summary Information:**
  - Status: All tests passed
  - Start Time: 20181014 15:15:06.621
  - End Time: 20181014 15:15:13.239

15:15:12.911	INFO	Selecting options from selection list 'name:year' by value 17.

## Conclusion

We have seen how to work with dropdown by value, index and label. We can refer to logs and reports to get the details of the test case executed.

# 13. Robot Framework — Working With Keywords

In Robot Framework, test cases are constructed in test case tables using keywords. In this chapter, we will cover the details on keywords used in Robot Framework. There are 2 types of keywords used in Robot:

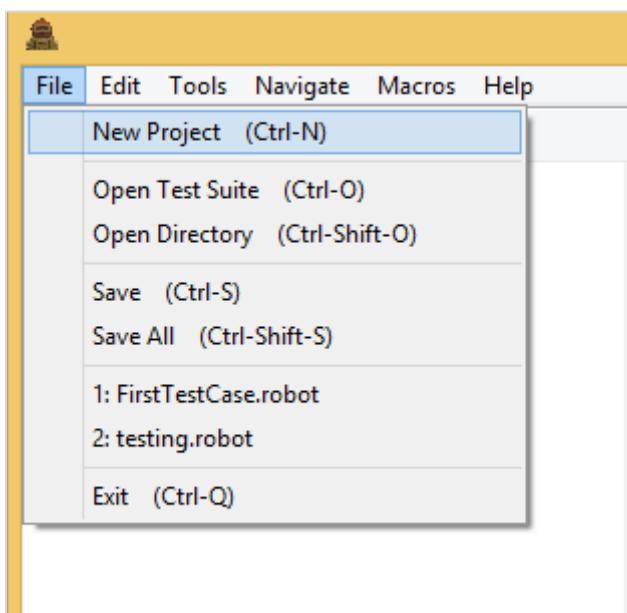

- Library Keywords
- User Defined Keywords

## Library Keywords

Library Keywords are keywords that come from the library we import in Robot Framework. We will now take a look at the Selenium library, which helps us interact with the browser. We will discuss some of the important keywords associated with selenium library.

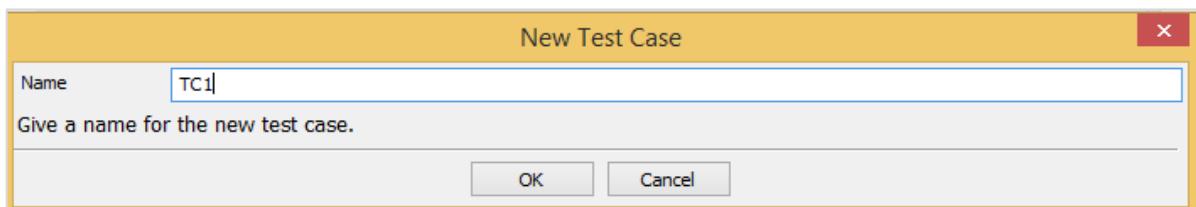

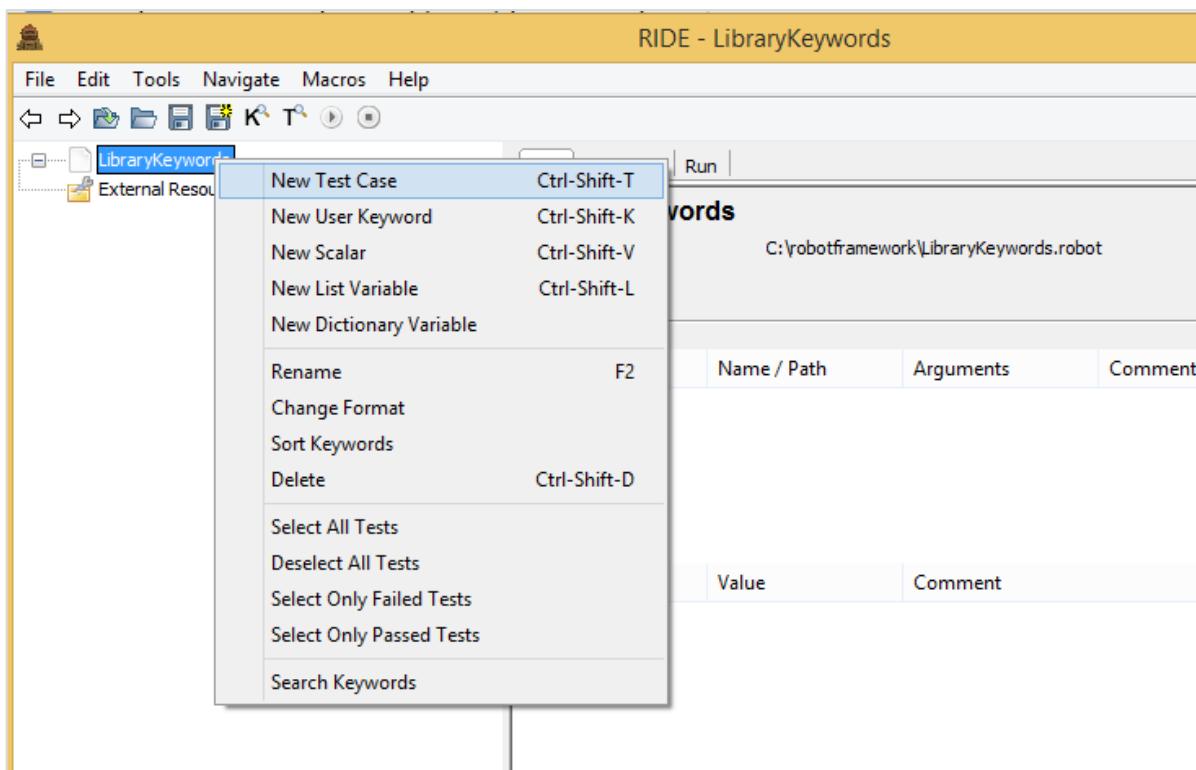

Follow the steps shown below to import Selenium library:

The details relating to the installation of Selenium library is discussed in chapter "**Working with Browsers using Selenium Library**". Open ride using **ride.py** from the command line.

Click on New Project and give name to your project. The name given to the project is **LibraryKeywords**.

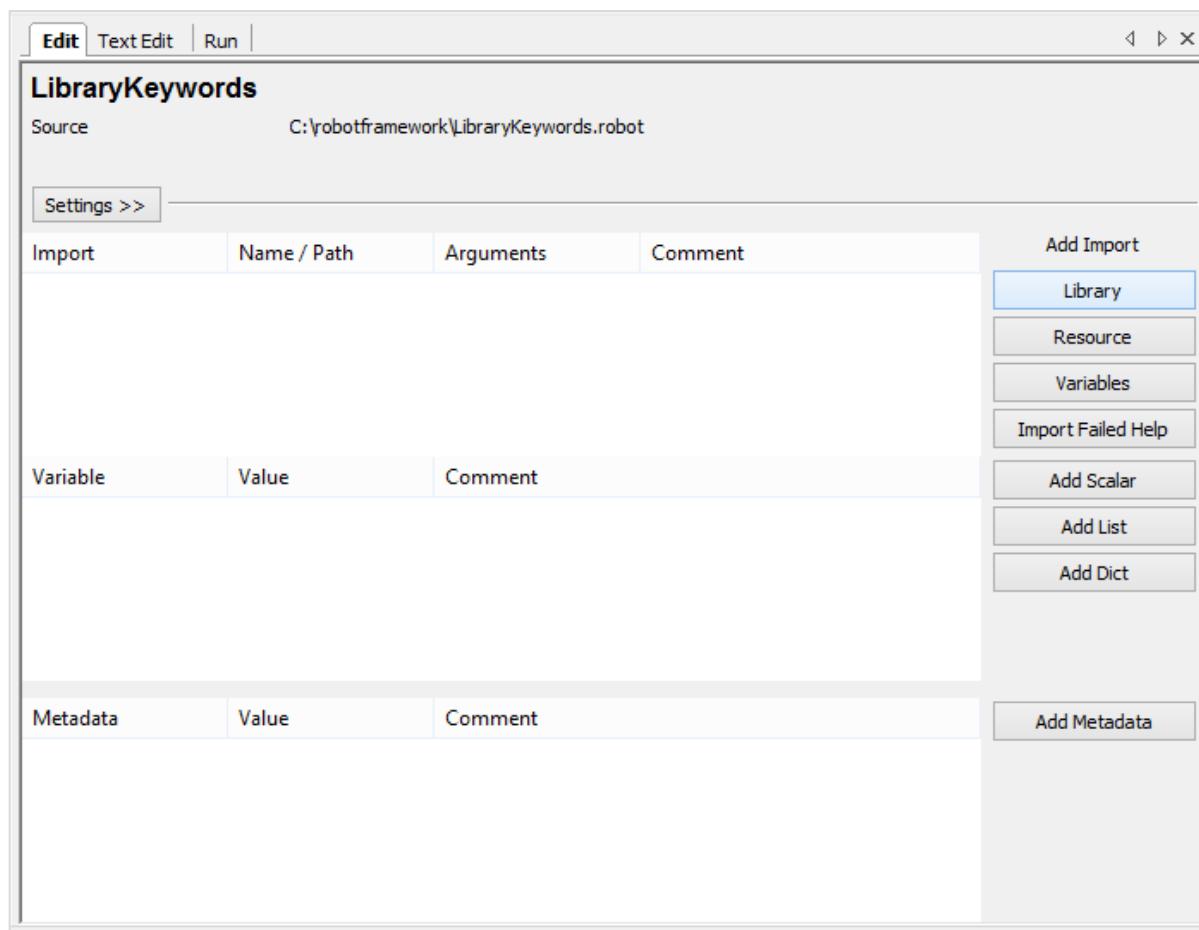

Right-click on the name of the project created and click on *New Test Case*:

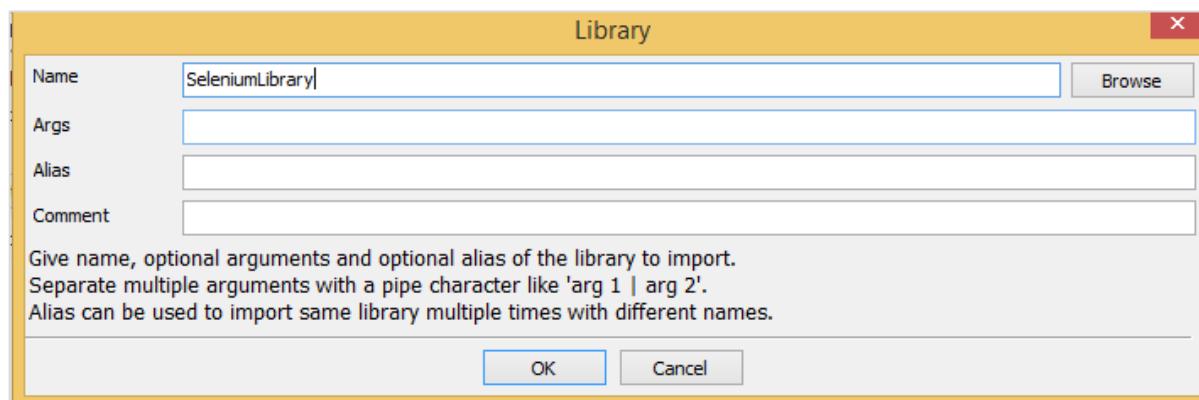

Give a name to the test case and click OK.

We are done with the project setup. Now, we will write test cases to show the working of library keywords. Since we need Selenium library, we need to import the same in our project.

Click on your project on the left side and click Library.

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

The screenshot shows the 'LibraryKeywords' interface in Robot Framework. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. Below the tabs, the title 'LibraryKeywords' is displayed, along with the source file path 'C:\robotframework\LibraryKeywords.robot'. A 'Settings >>' button is located in the top-left corner of the main area.

The main area contains three tabular forms:

- Import:** Shows one entry: 'Library' with 'SeleniumLibrary' selected. To the right is a vertical toolbar with buttons for 'Add Import' (highlighted in blue) and other options like 'Resource', 'Variables', etc.
- Variable:** An empty table with columns for 'Variable', 'Value', and 'Comment'.
- Metadata:** An empty table with columns for 'Metadata', 'Value', and 'Comment'.

The name given has to match with the name of the folder installed in site-packages.

Now will create test case in the project created and use a few important keywords.

Click on your test case created TC1 and in the tabular form enter the keywords to open the browser and enter data inside the form opened.

Here is a simple test case using Library Keywords:

1	Open Browser	https://www.tutorialspoint.com	chrome
2	Maximize Browser Window		
3	Input Text	name=search	This is entered from robotframework testcase
-			

*Open Browser*

To get more details of this keyword, while typing the keyword press ctrl + spacebar. It will show the details of the library keyword entered.

Here is an example for Open Browser, and if any help required for that keyword you can make use of ctrl + spacebar while typing the keyword.

## Open Browser Keyword Details

**Open Browser**

**Name:** Open Browser

**Source:** SeleniumLibrary <test library>

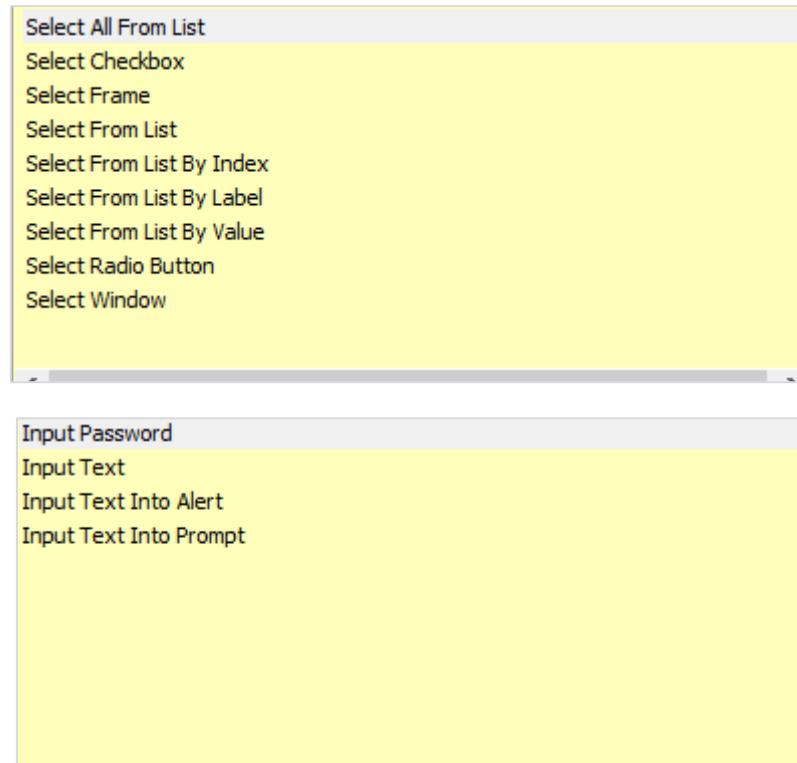

**Arguments:** [ url | browser=firefox | alias=None | remote\_url=False | desired\_capabilities=None | ff\_profile\_dir=None ]

Opens a new browser instance to the given url.

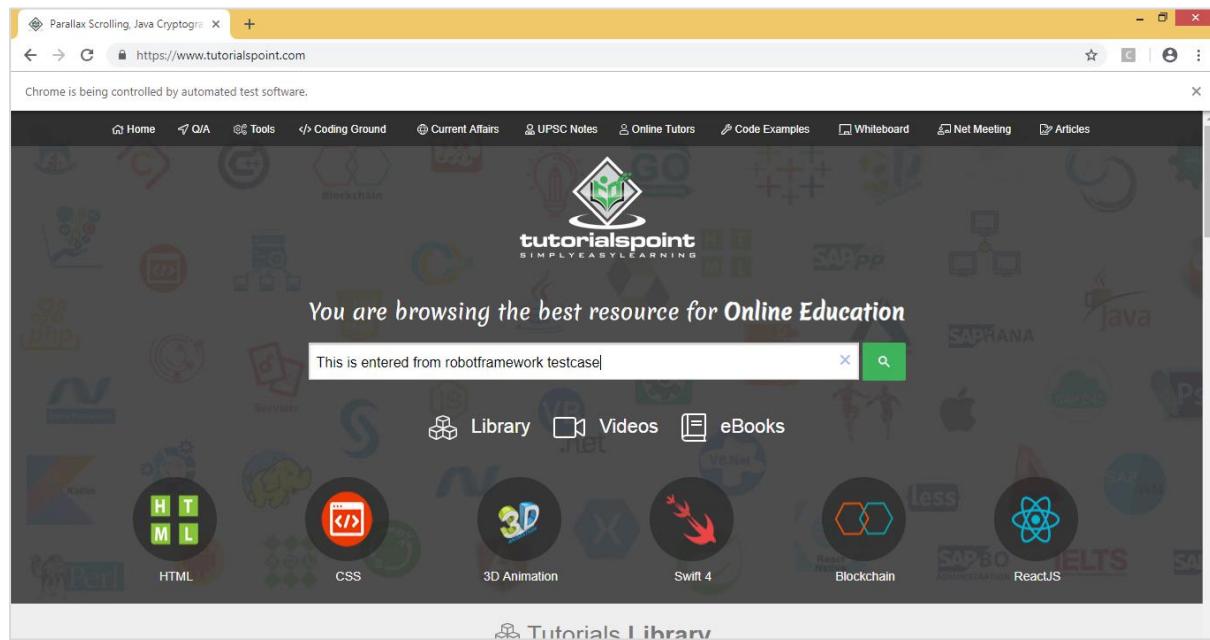

The `browser` argument specifies which browser to use, and the supported names for each browser are listed in the table below. The browser names are case-insensitive. Some browsers have multiple supported names.

Browser	Name(s)
Firefox	firefox, ff
Google Chrome	googlechrome, chrome, gc
Headless Firefox	headlessfirefox
Headless Chrome	headlesschrome
Internet Explorer	internetexplorer, ie
Edge	edge
Safari	safari
Opera	opera

Similarly, we have Library keywords to work with Input, Radio, Text, etc

We will execute the test case we entered to open the browser with URL: <https://www.tutorialspoint.com> and enter details in the input text.

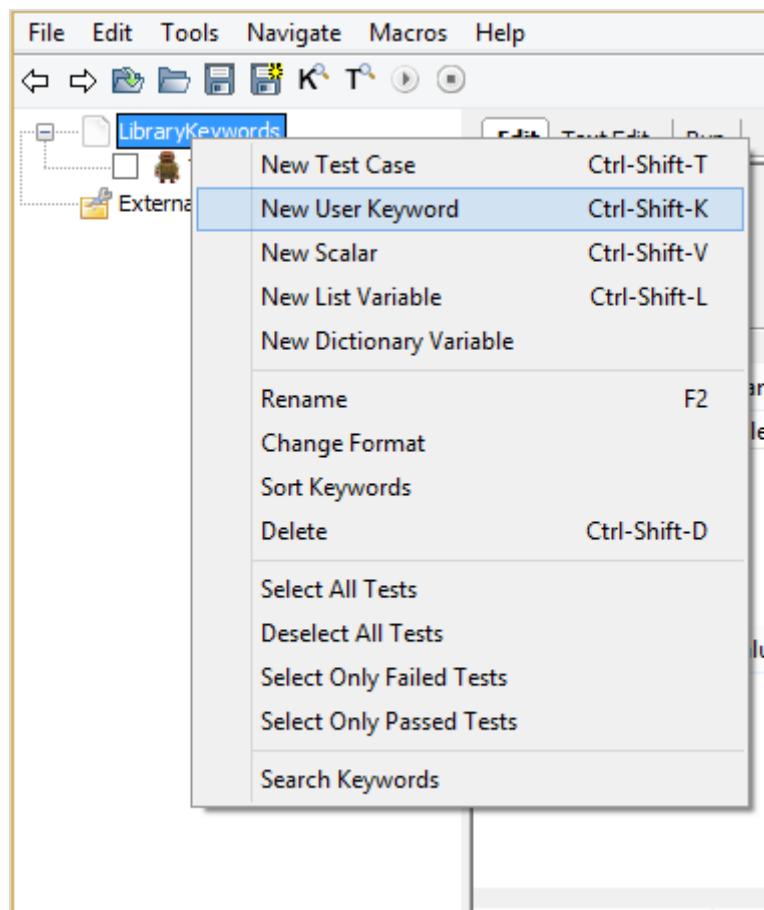

We have executed the test case. You can see the textbox has all the details we gave in the test case.

## User-defined Keywords

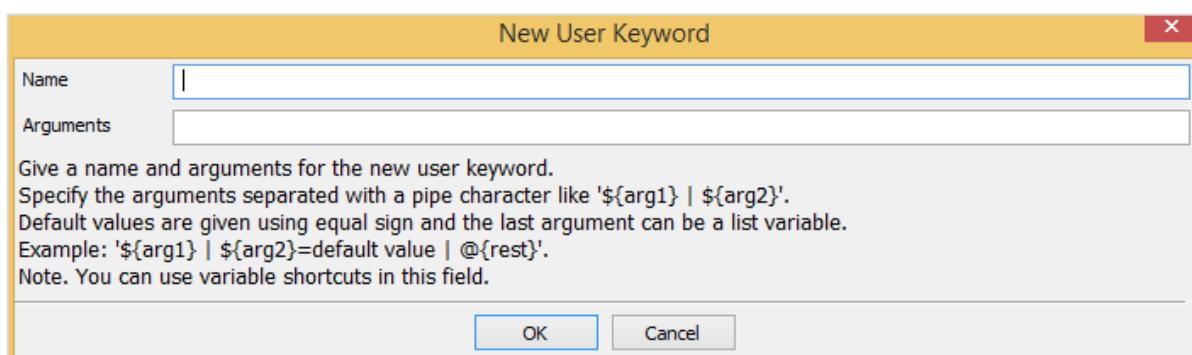

User-defined keywords can be created to perform a particular action in the test case or it can also be created using the library keywords and built-in keywords in robot framework. We will work on an example and see how we can create keywords for our test case.

We will use the same project that we created above and create user-defined keywords in that and use in the test case.

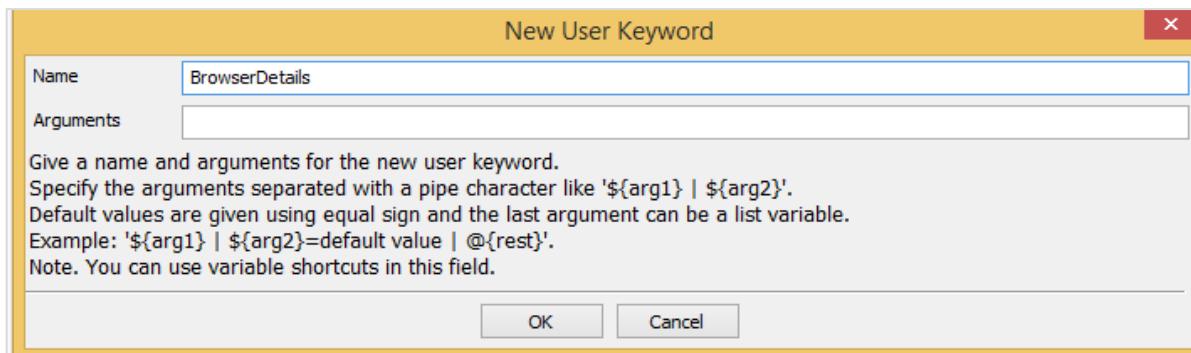

To create keyword in Ride, right-click on your project and click on *New User Keyword* as shown below:

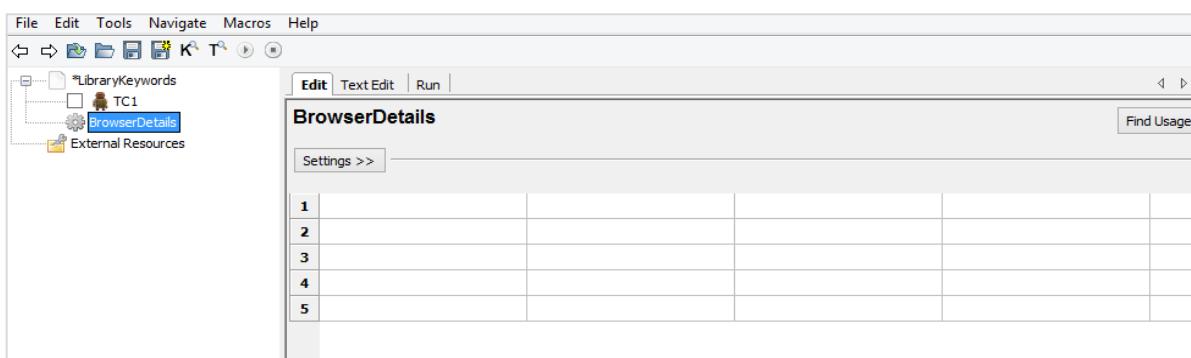

Upon clicking New User Keyword, a screen appears as shown below:

Enter the Name of the keyword and click OK. The screen also shows Arguments. We will discuss what arguments have to do with Keywords in a subsequent section.

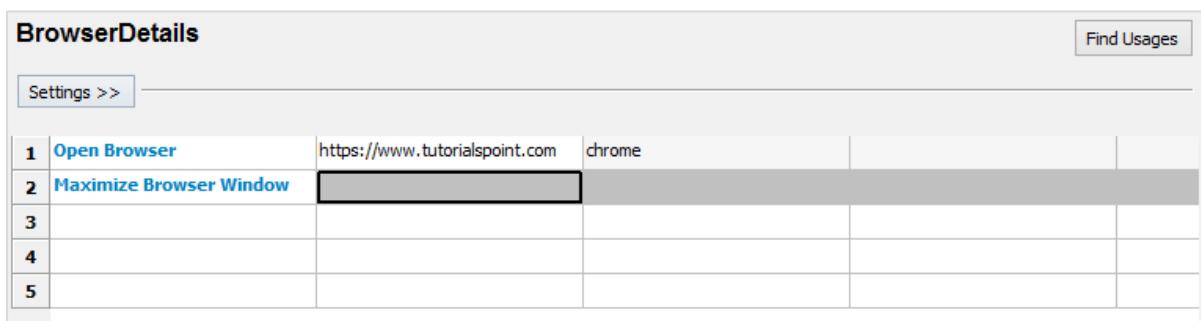

We have given the name BrowserDetails to the keyword. Click OK to save it. The keyword BrowserDetails is created.

To test the URL in the browser, we repeatedly have to enter open browser, **maximize browser** keywords.

Now, we will create a user-defined keyword that will have *open browser* and *maximize browser* details. The keyword created will be used in our test case.

Our BrowserDetails keyword is a combination of other keywords used repeatedly.

Now, we will use the keyword created in the test case as shown below.

## Test case

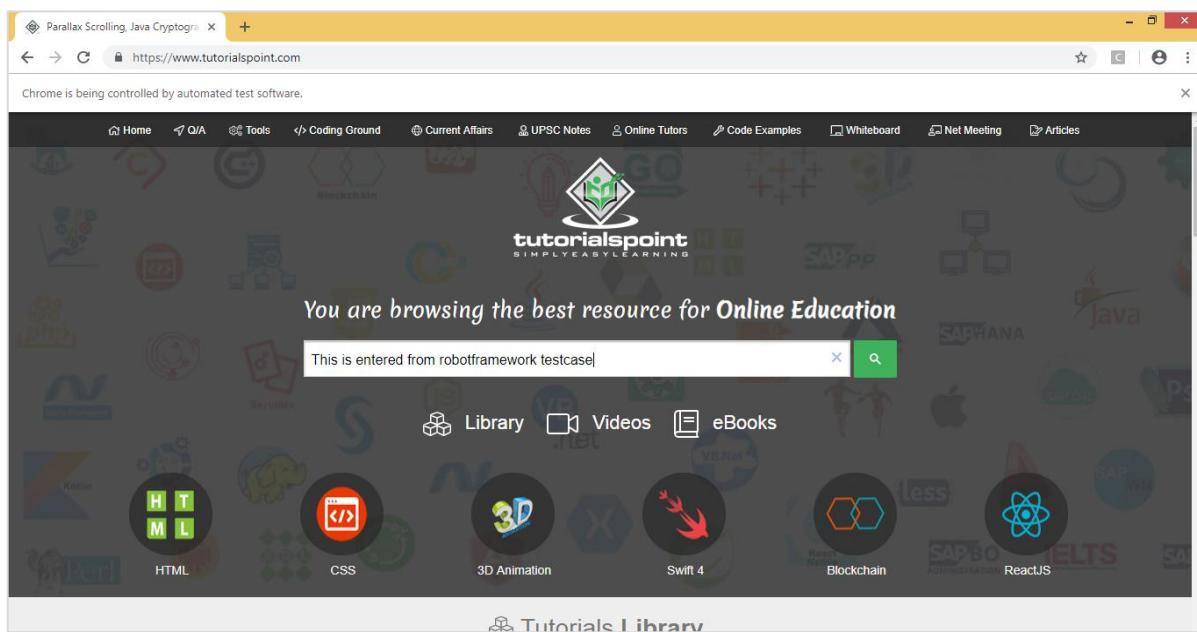

1	Open Browser	https://www.tutorialspoint.com	chrome
2	Maximize Browser Window		
3	Input Text	name=search	This is entered from robotframework testcase

Considering the above test case, we are going to use the user-defined keyword *BrowserDetails*.

We will now replace 1 and 2 keywords with the user-defined keyword:

1	BrowserDetails		
2	Input Text	name=search	This is entered from robotframework testcase
3			

Let us now run the test case to see the output:

The execution of the test case works perfectly fine.

Now, we will see the use-case of arguments in keywords.

Here is the keyword that we created:

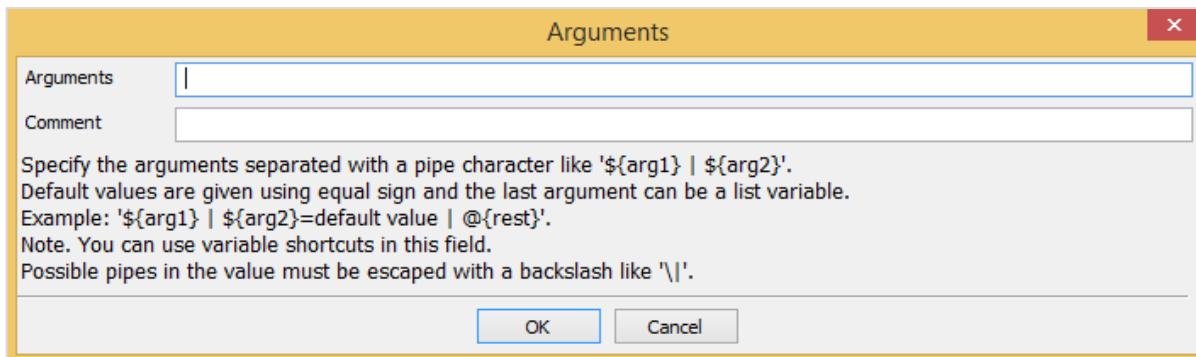

BrowserDetails				Find Usages
Settings >>				
1	Open Browser	https://www.tutorialspoint.com	chrome	
2	Maximize Browser Window			
3				
4				
5				

The name of the keyword is *BrowserDetails*. We can use this keyword in other test cases created under the project. The keyword contains the URL of the browser hardcoded. If we want to use the keyword in another test case with a different URL, it will not be possible.

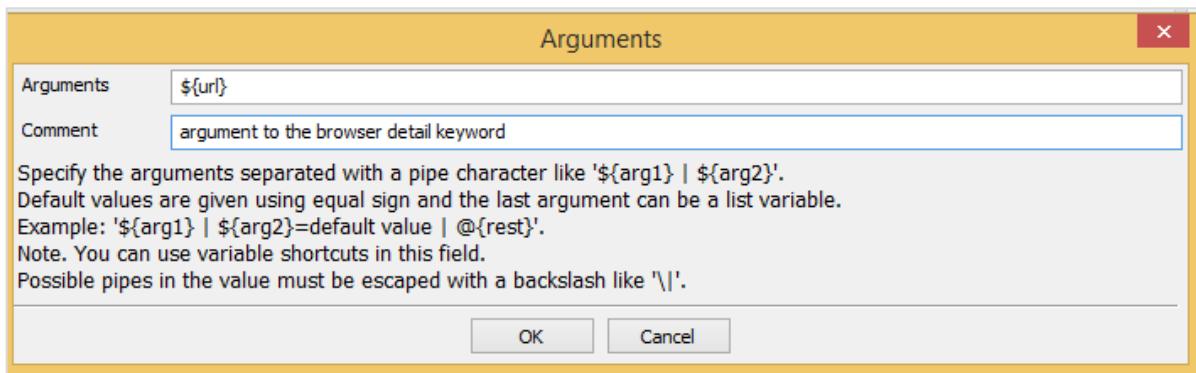

We can use arguments to help us with the hardcoded parameters. We will go back to the keyword created and make use of arguments.

Edit				Text Edit	Run	Find Usages
<b>BrowserDetails</b>						
Settings <<						
Documentation					Edit	Clear
Tags				<Add New>		
Arguments					Edit	Clear
Teardown					Edit	Clear
Return Value					Edit	Clear
Timeout					Edit	Clear
1	Open Browser	https://www.tutorialspoint.com	chrome			
2	Maximize Browser Window					
3						
4						
5						
6						
7						

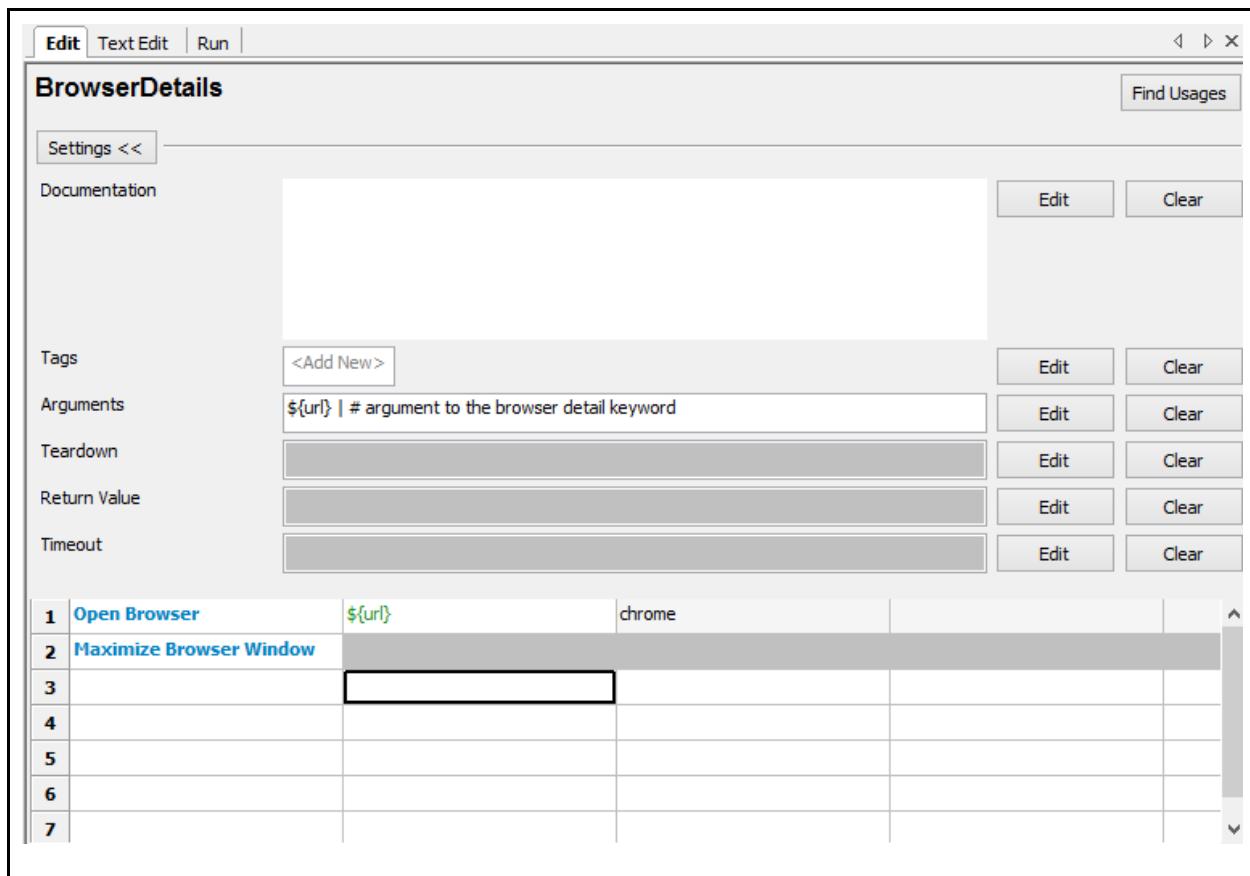

Click on Edit against the Arguments.

Enter the argument to be used with the keyword.

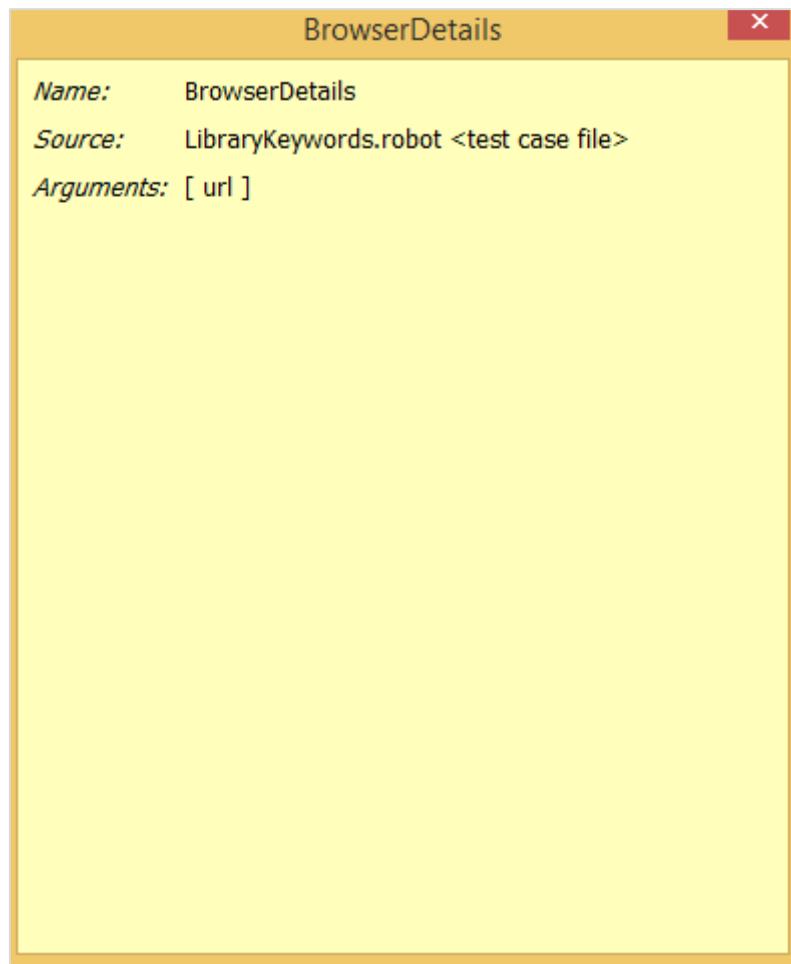

If there is more than 1 argument, you can separate them using pipe (|). We will now use the argument in the Keyword specified as follows:

Go back to your test case. Now, you need to pass the value which is the URL to be used for the test case.

In the test case, when you type the user-defined keyword and press Ctrl + Spacebar, it gives the details of the keyword along with the arguments.

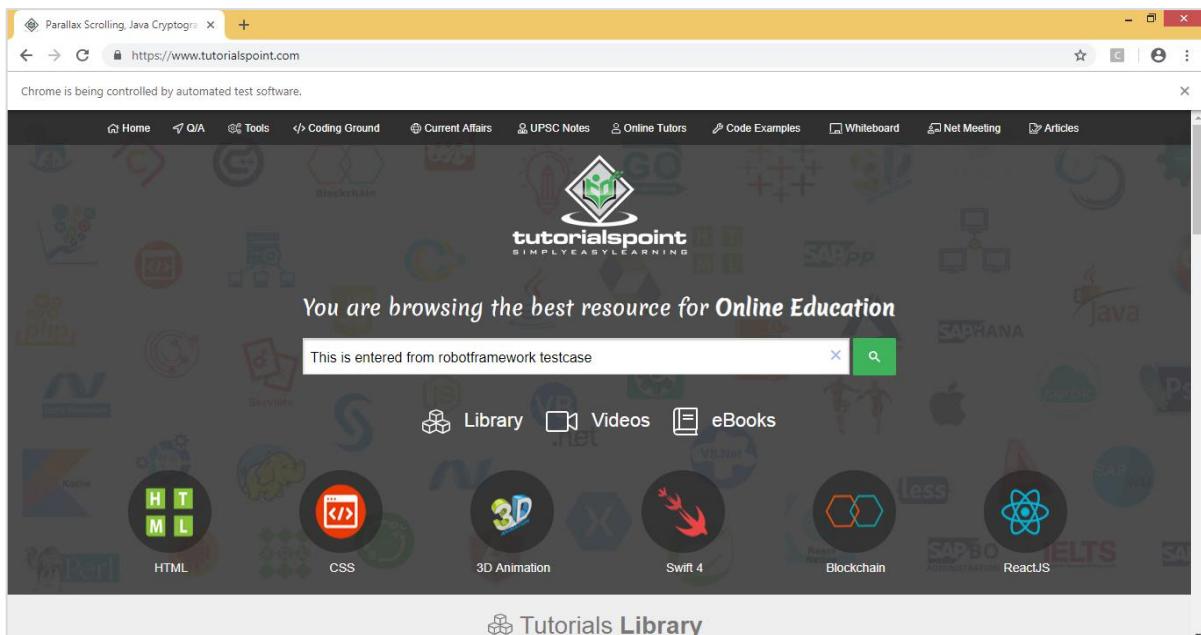

Following are the details for keyword BrowserDetails:

The test case now will have the URL to be passed as argument.

1	BrowserDetails	https://www.tutorialspoint.com	
2	Input Text	name=search	This is entered from robotframework testcase
3			
4			

Let us now run the test case to see the output:

The Keyword and the arguments passed to the user-defined keyword are working fine.

Let us now change the URL; we will use <https://www.google.com>.

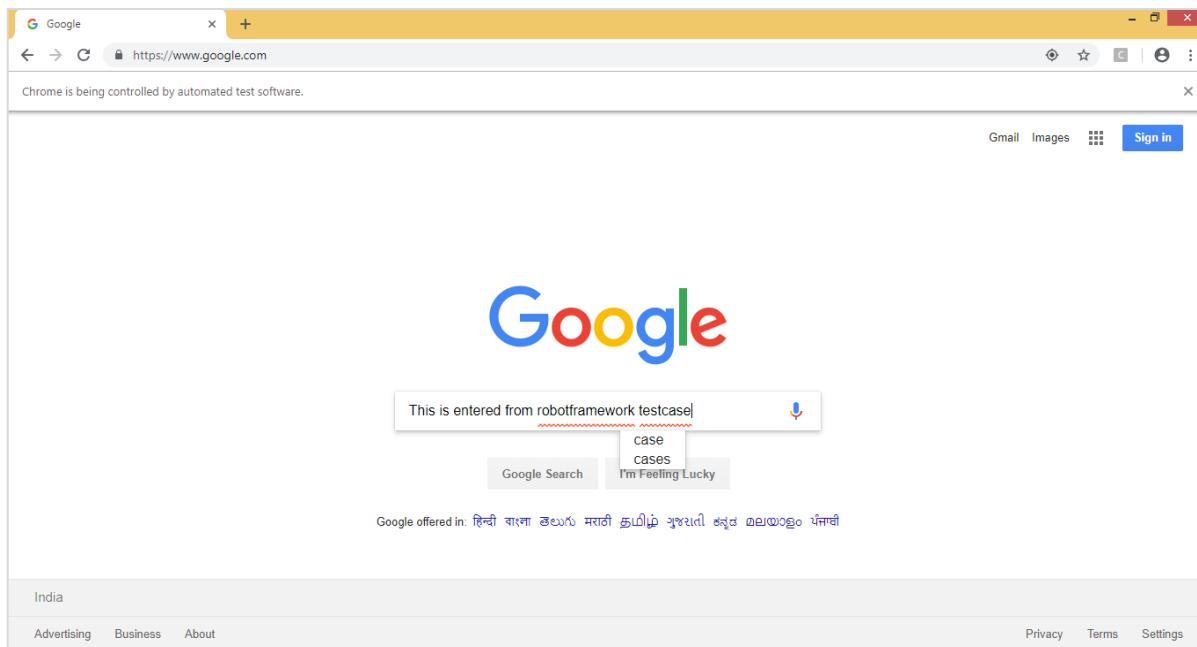

1	<b>BrowserDetails</b>	https://www.google.com	
2	<b>Input Text</b>	id=lst-ib	This is entered from robotframework testcase
3			
4			
5			

The URL for keyword BrowserDetails is changed to <https://www.google.com>.

We have changed the argument to Input Text to the id available from google site. To get the id or name or class of the input field, you can inspect and check in the browser.

Let us run the above test case and see the output.

Upon successful execution, the above test case generates the following output:

## Conclusion

---

In this chapter, we have seen how to get help for built-in keywords. We have also seen how to create user-defined keywords, which can be a combination of library keywords and built-in keywords.

# 14. Robot Framework — Working With Variables

In this chapter, we will discuss how to create and use variables in Robot Framework. Variables are used to hold a value, which can be used in test cases, user-defined keywords, etc.

We are going to discuss following variables available in Robot Framework

- Scalar Variable
- List Variable
- Dictionary Variable

We will understand the working of each of this variable with the help of test cases in Ride.

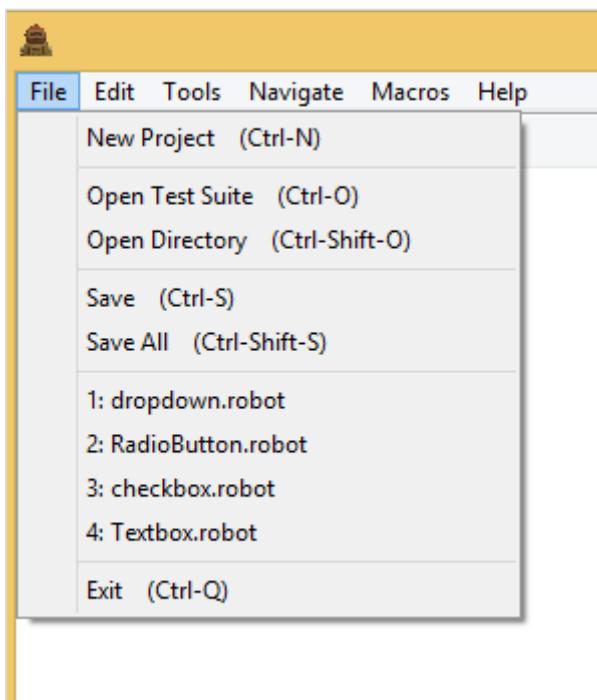

## Scalar Variable

Scalar variables will be replaced with the value they are assigned. The syntax for scalar variable is as follows:

```
${variablename}
```

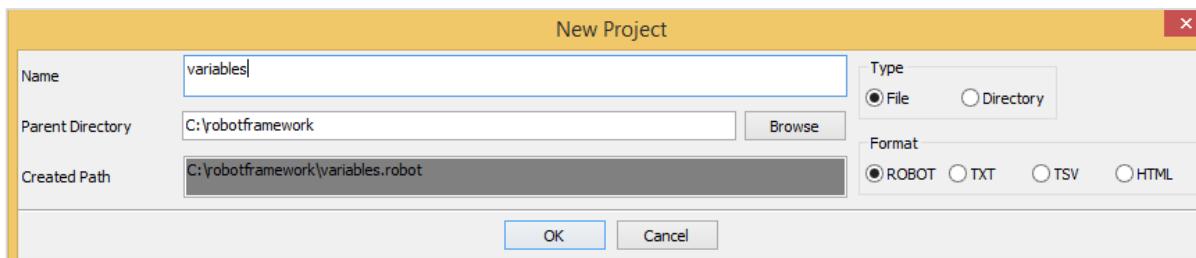

We can use scalar variable to store strings, objects, lists, etc. We will first create a simple test case and make use of scalar variable in it.

Open RIDE using **ride.py** in the command line and create a new project.

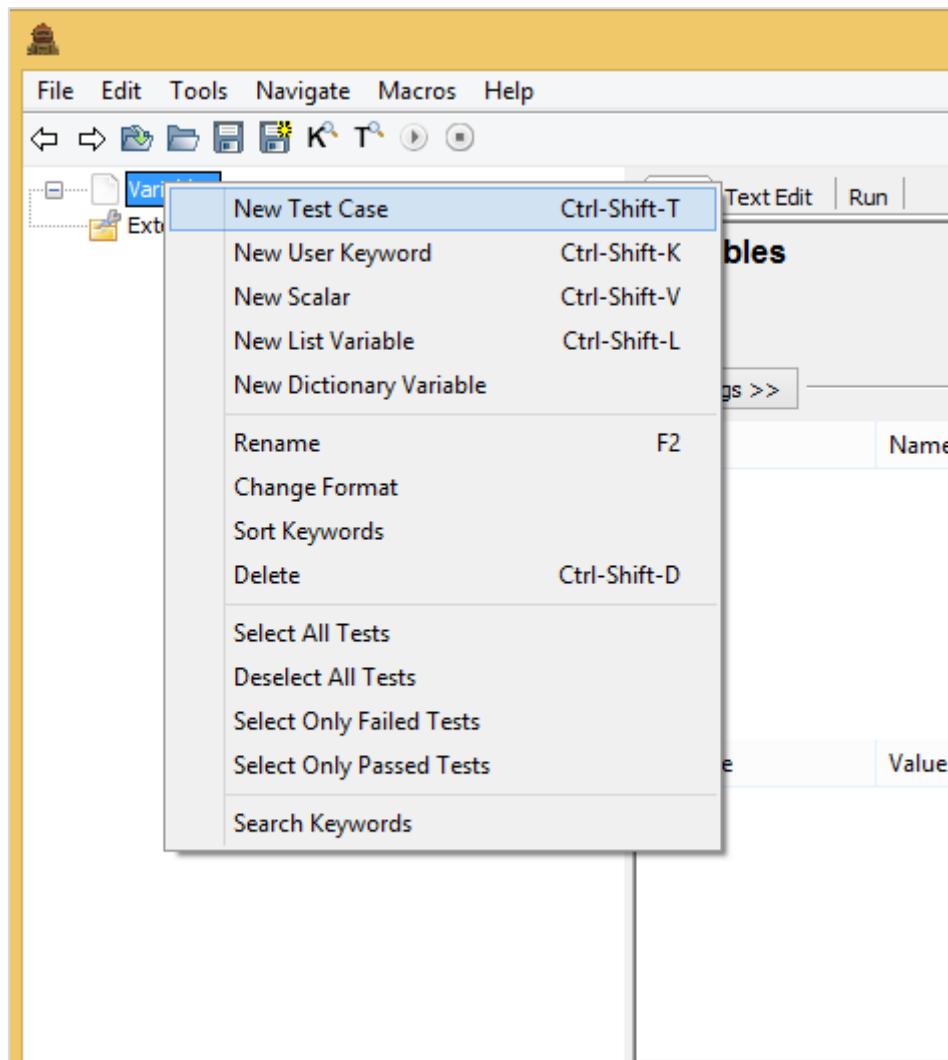

Click **New Project**.

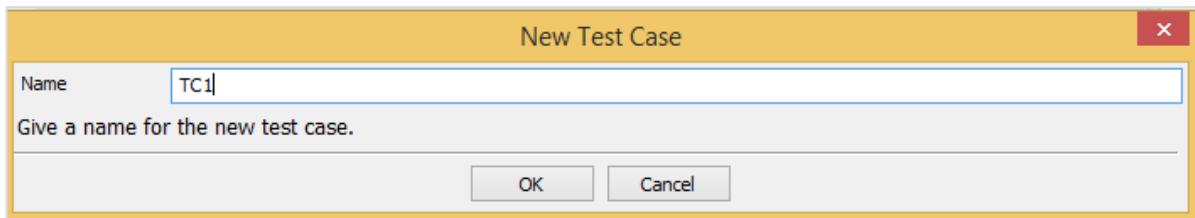

Now, give a name to your project.

The name given is *variables*. Click OK to save the project.

Right-click on the name of the project created and click on *New Test Case*:

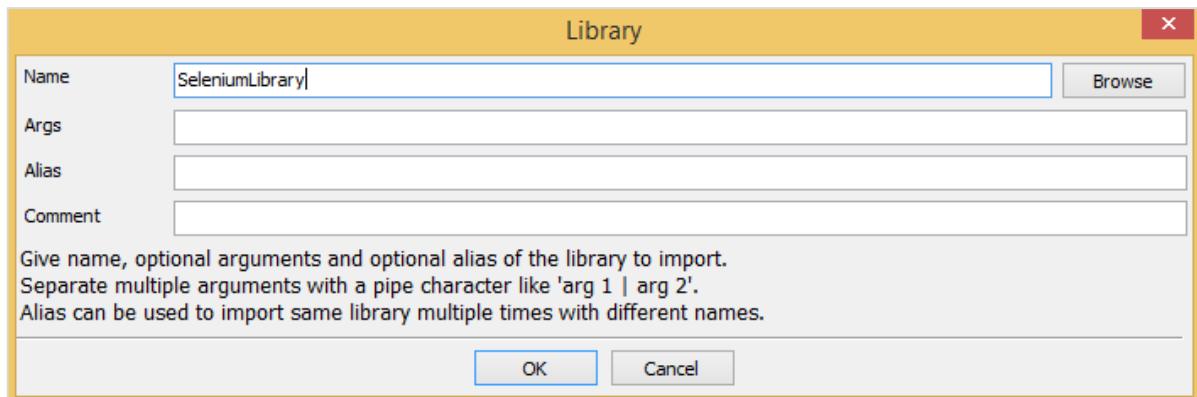

Give a name to the test case and click OK.

We are done with the project setup and now will write test cases for the scalar variables to be used in our test case. Since we need Selenium library, we need to import the same in our project.

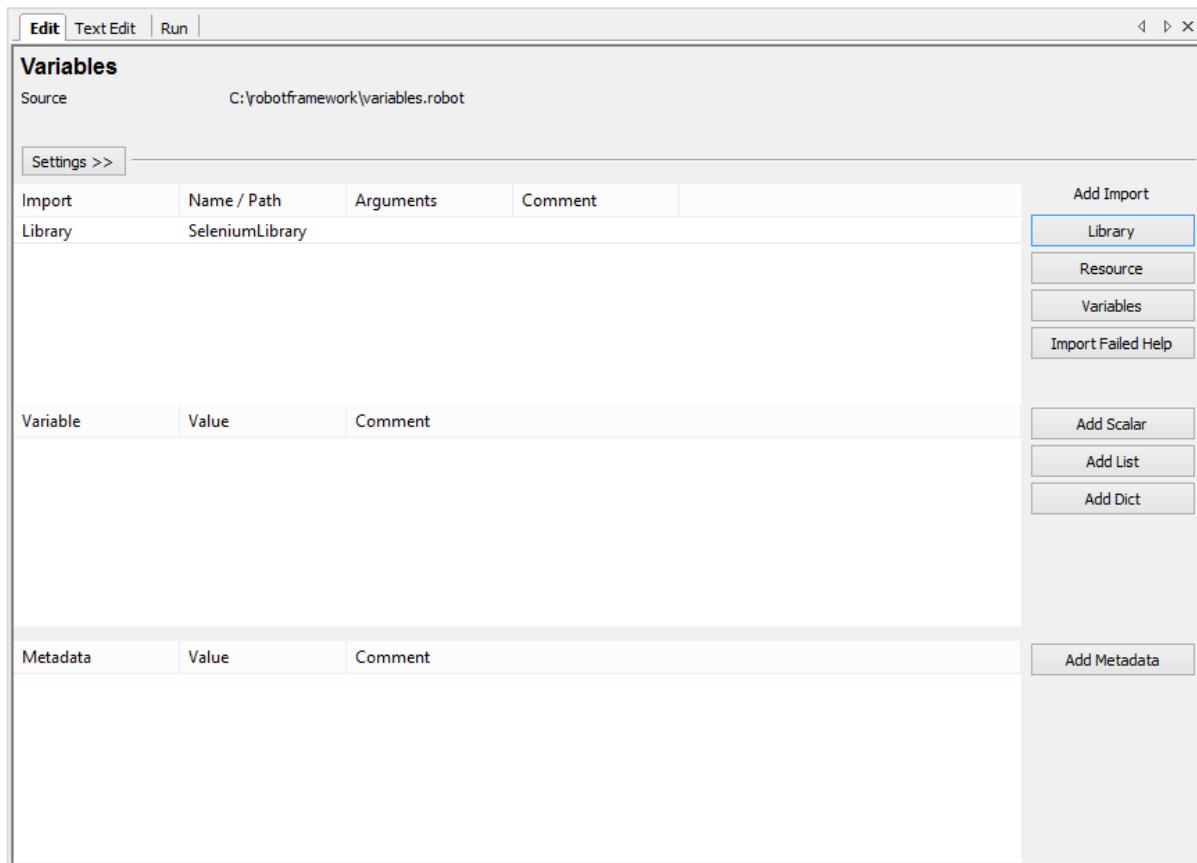

Click on your project on the left side and use Library from Add Import:

The screenshot shows the 'Variables' tab in the Robot Framework IDE. The 'Source' field is set to 'C:\robotframework\variables.robot'. The main area contains three tables: 'Import', 'Variable', and 'Metadata'. The 'Import' table has columns for 'Import', 'Name / Path', 'Arguments', and 'Comment'. The 'Variable' and 'Metadata' tables have columns for 'Variable', 'Value', 'Comment', and 'Metadata'. To the right of the 'Import' table is a vertical context menu with the following options: 'Add Import' (with 'Library' selected, 'Resource', 'Variables', and 'Import Failed Help' sub-options), 'Add Scalar', 'Add List', 'Add Dict', and 'Add Metadata'.

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

The name given has to match with the name of the folder installed in site-packages.

If the name does not match, the library name will be shown in red:

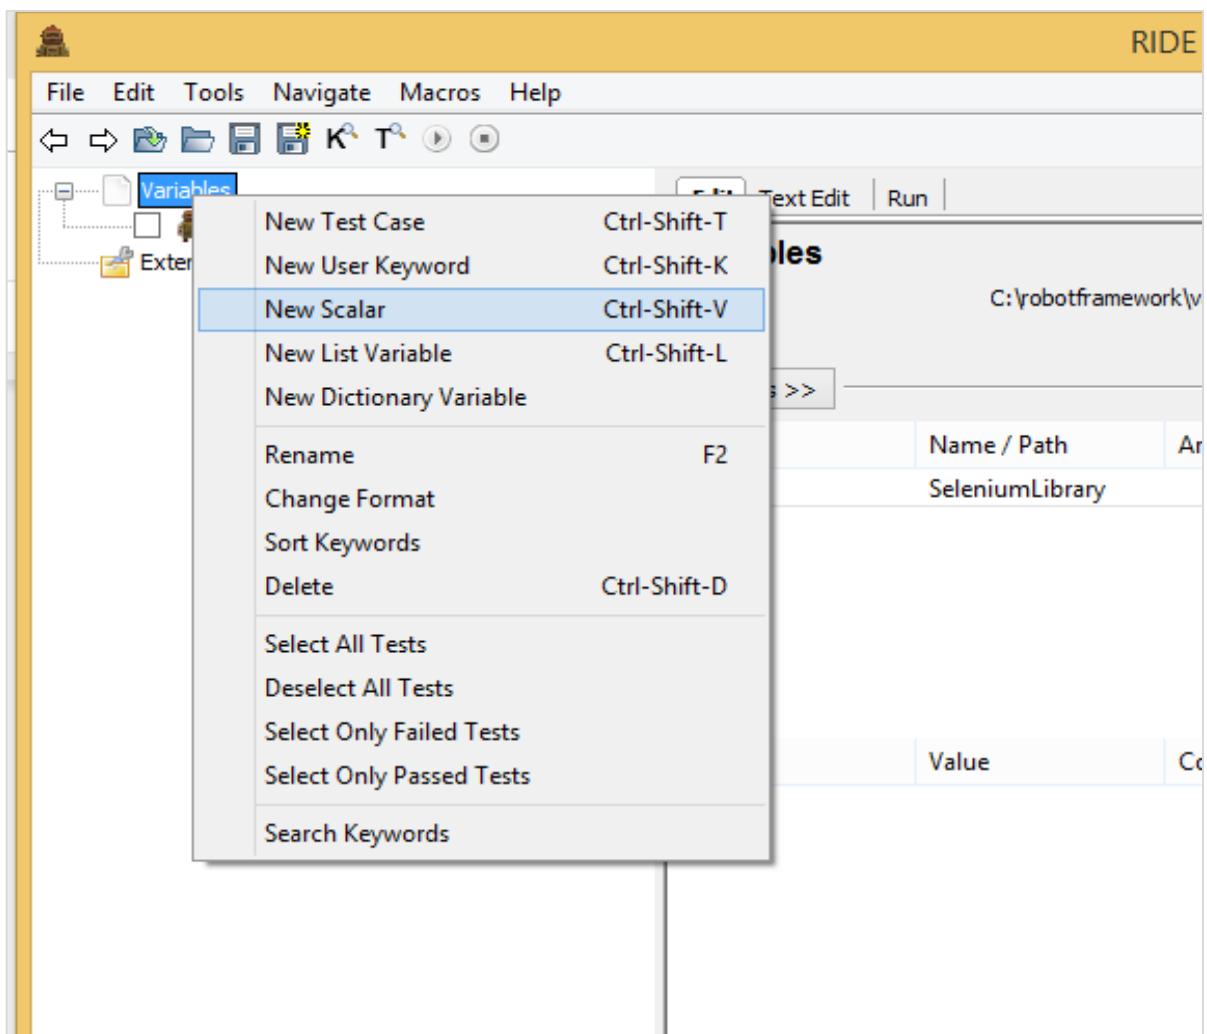

The screenshot shows the 'Variables' editor window. At the top, there are tabs for 'Edit', 'Text Edit', and 'Run'. The 'Source' field is set to 'C:\robotframework\variables.robot'. Below this, there's a 'Settings >>' button. The main area displays three imported libraries: 'SeleniumLibrary' (in blue) and 'seleniumlibrary' (in red). To the right, a sidebar contains buttons for adding imports ('Add Import') and metadata ('Add Metadata'). The sidebar also includes buttons for adding scalar, list, and dict variables.

## Test Case for Scalar Variable

In the above test cases we hardcoded the values like the URL, email, password, which we are giving to the test case. The values used can be stored in a variable and instead of hardcoding, we can use the variable in those places.

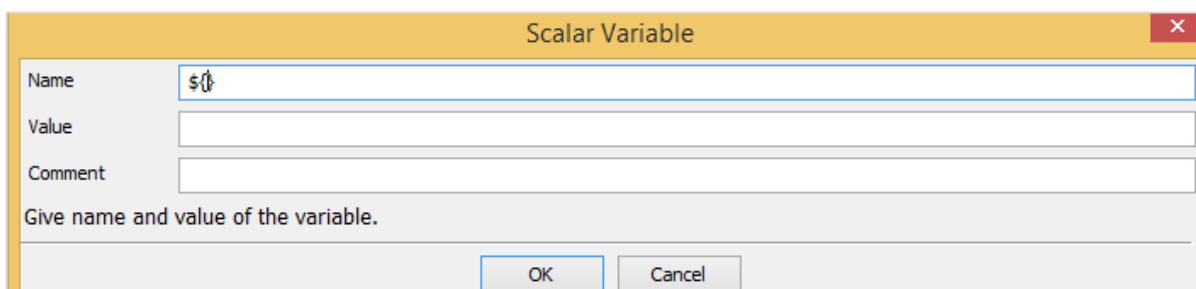

1	<b>Open Browser</b>	http://localhost/robotframework/	chrome		
2	<b>Input Text</b>	id:email	admin@gmail.com		
3	<b>Input Password</b>	id:passwd	admin		
4	<b>Click Button</b>	id:btnsubmit			
5					

To create scalar variable, right-click on your project and click on *New Scalar* as shown below:

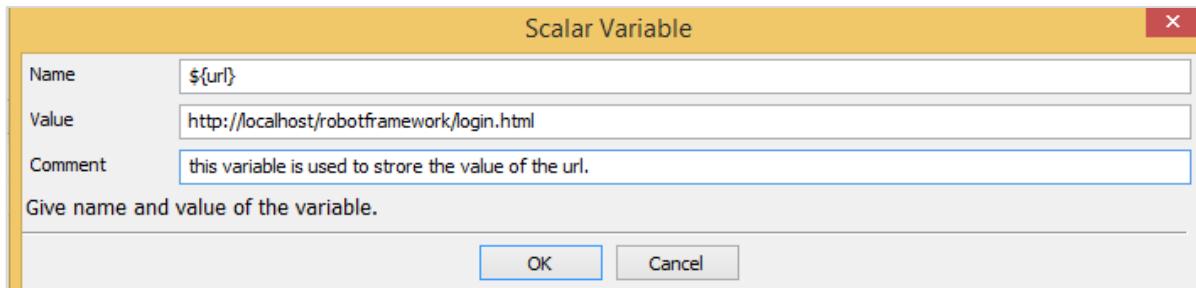

Clicking on *New Scalar* will open the following screen to create the variable and the value we need to replace with when the variable is used inside test cases.

We get \${ } for the *Name* field.

Here we need to enter the name of the variable inside the curly braces as shown in the screen below:

The name of the variable is \${url}. The value is - <http://localhost/robotframework/login.html>.

We added the comment as shown above. Click OK to save the scalar variable. The details of the variable are added as shown below:

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

  

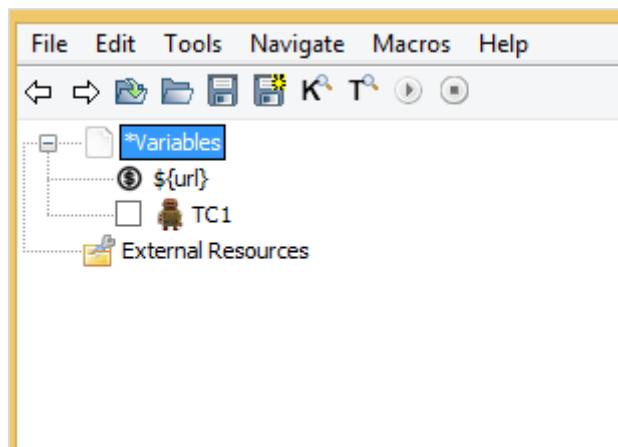

Variable	Value	Comment
\${url}	http://localhost/robotframework/login.html	# this variable is used to store the value of the url.

Metadata	Value	Comment

The variable name is shown under the project created as follows:

Let us now use the scalar variable created inside our test case.

### Test case with URL hardcoded

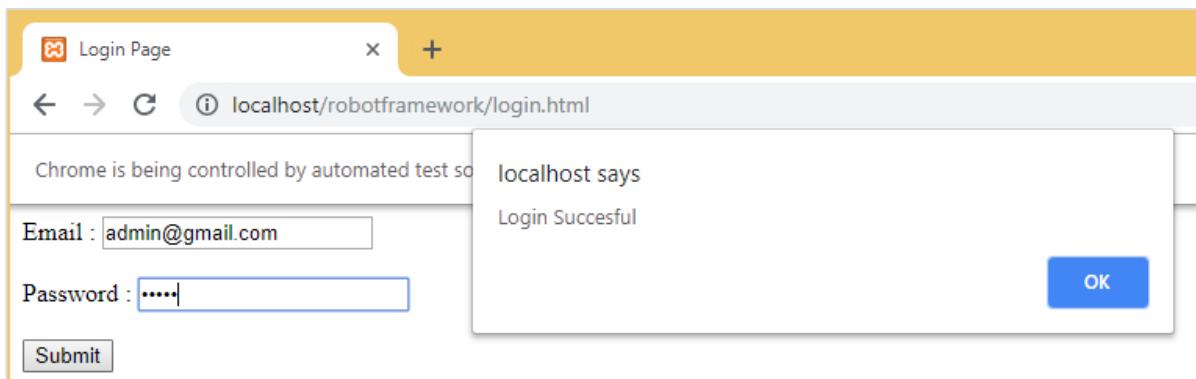

1	Open Browser	http://localhost/robotframework/login.html	chrome		
2	Input Text	id:email	admin@gmail.com		
3	Input Password	id:passwd	admin		
4	Click Button	id:btnsubmit			
5					

In the above test case, we have to replace the URL with the variable we just created above.

### Test Case with Scalar Variable for URL

1	Open Browser	`\${url}`	chrome		
2	Input Text	id:email	admin@gmail.com		
3	Input Password	id:passwd	admin		
4	Click Button	d:btnsubmit			
5					

Now, we will run the test case to see if it is taking the URL from the variable. Below is the output that we get when we run it. The URL <http://localhost/robotframework/login.html> is picked up from the scalar variable we created.

## Execution Details

```

Edit | Text Edit | Run
Execution Profile: pybot | Report | Log | Autosave | Pause on failure | Show message log
Start | Stop | Pause | Continue | Next | Step over
Arguments:

test finished 20181014 18:19:14

```

The advantage of using variables is that you can change the value for that variable and it will be reflected in all test cases. You can use the variables in many test cases that you create under that project. Hardcoding of values can be a serious problem when you want to change something, you will have to go to individual test case and change the values for it. Having variables in one place gives us the flexibility to test the way we want with different values to the variables.

Now, we will look into the next type of variable called the List variable.

## List Variable

List variable will have an array of values. To get the value, the list item is passed as the argument to the list variable.

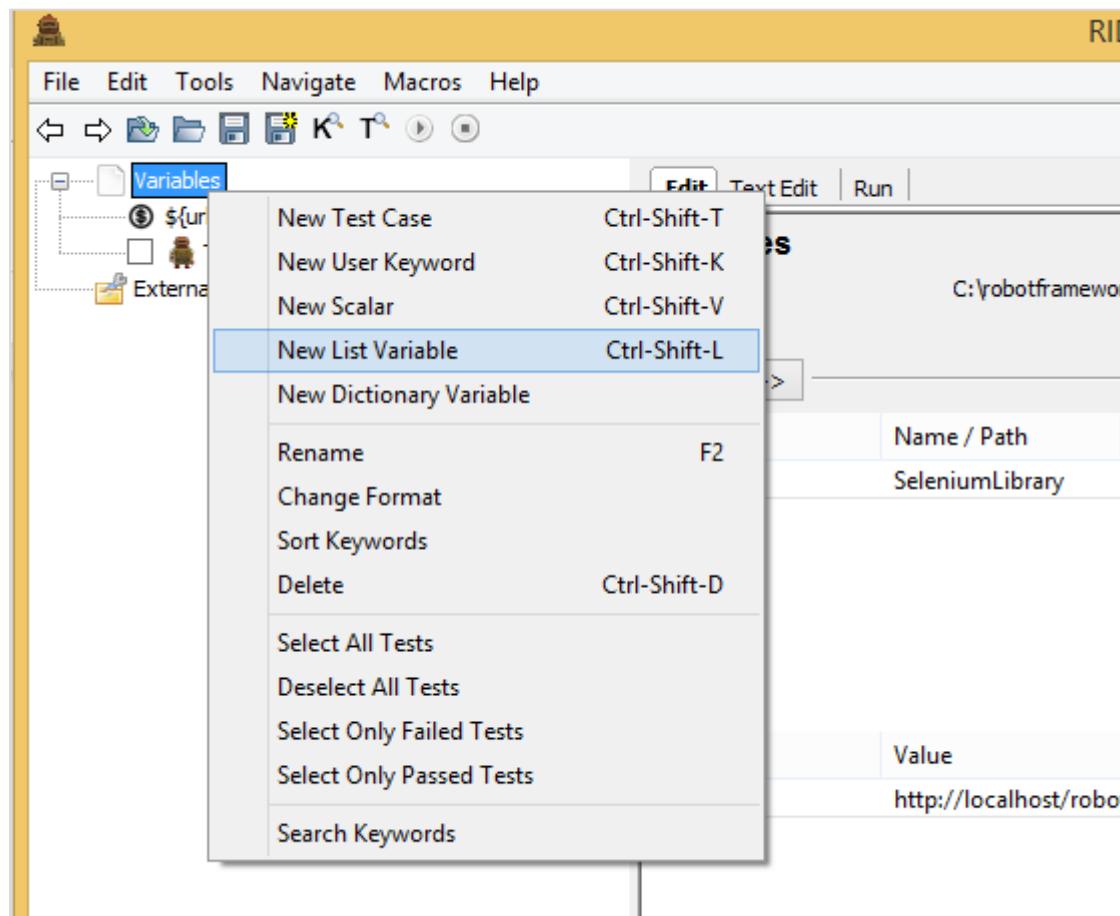

### Syntax

```
@{variablename}
```

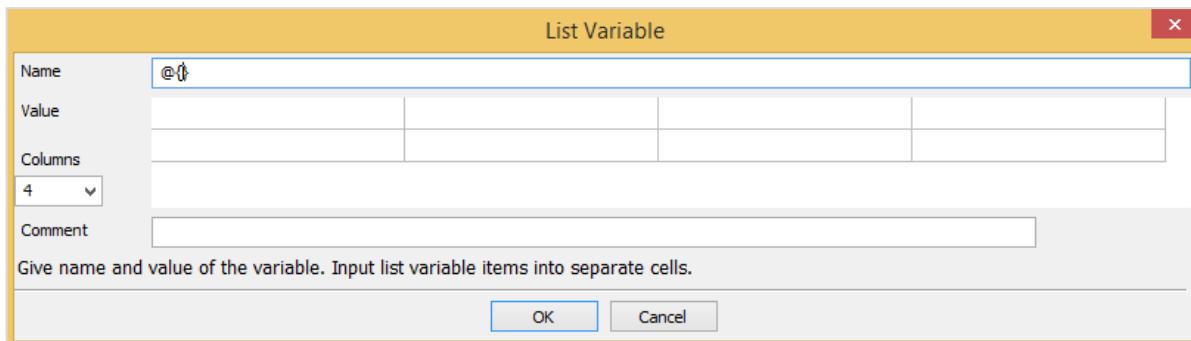

Suppose we have values A, B. To refer the values, we need to pass the list item as follows:

```
@{variablename}[0] // A
@{variablename}[1] // B
```

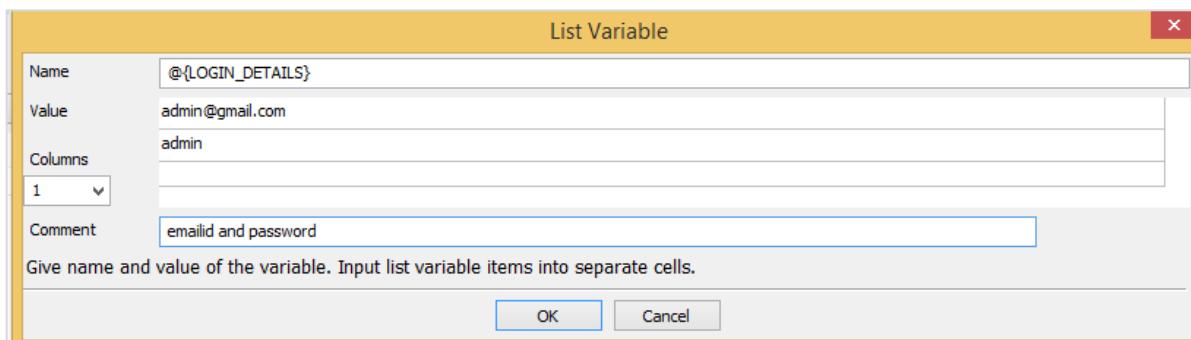

To add list variable, right-click on the project and click **New List Variable**.

Upon clicking *New List Variable*, a screen appears where we can enter the values:

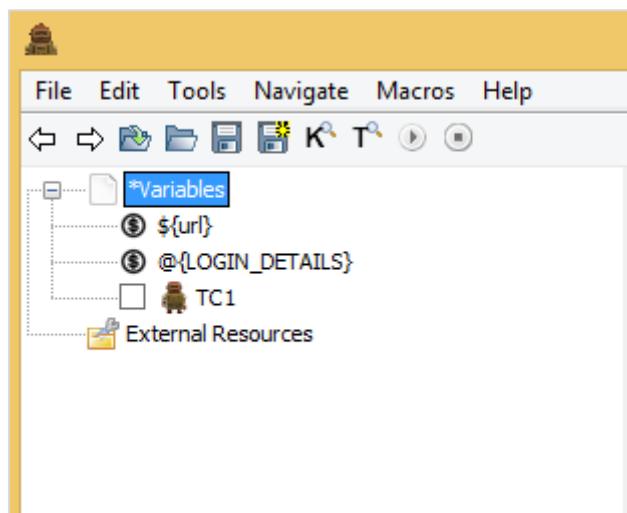

The Name is given as **@{}** followed by Value. It also has 4 Columns selected. Right now, we will use just Column 1 and create the list variable, which will have values, email id and password as follows:

The name of the list variable is **@{LOGIN\_DETAILS}** and the values given are **admin@gmail.com** and **admin**, which has email id and password for the login page.

Click OK to save the list variable. The variable is listed below the project as shown here:

The details of variables used are listed in the settings tab:

The screenshot shows the Robot Framework interface with the 'Edit' tab selected. In the 'Variables' section, the source file is specified as 'C:\robotframework\variables.robot'. A table lists imported libraries and variables:

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

Variable	Value	Comment
\$url	http://localhost/robotframework/login.html	# this variable is used to store the value of the url.
@{LOGIN_DETAILS}	admin@gmail.com   admin	# emailid and password

Now, we will add the list variable inside the test cases as shown below.

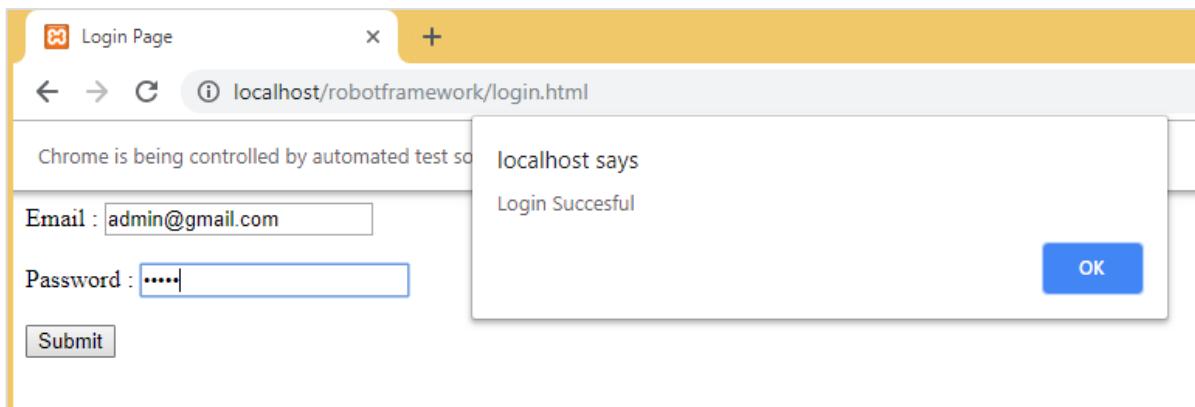

Here, we have hardcoded values for the Input Text and Password. Now, we will change it to use the list variable.

1	Open Browser	\${url}	chrome		
2	Input Text	id:email	admin@gmail.com		
3	Input Password	id:passwd	admin		
4	Click Button	id:btnsubmit			
5					

### Using List Variable

1	Open Browser	\${url}	chrome		
2	Input Text	id:email	@{LOGIN_DETAILS}[0]		
3	Input Password	id:passwd	@{LOGIN_DETAILS}[1]		
4	Click Button	id:btnsubmit			
5					

Now, we will execute the test case to see if it is taking the values from the list variable:

It has taken the email id and password from the list variable as shown above in the test screen.

The following screenshot shows the execution details for the same:

```

Edit | Text Edit | Run
Execution Profile: pybot
Arguments:
elapsed time: 0:00:10  pass: 0  fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDE5y_mcs.d\argfile.txt --listener C:\Users\KAMAT\PycharmProjects\RobotFramework\Reports\Listener.html

< >

```

In our next section, we will learn about the Dictionary Variable.

## Dictionary Variable

Dictionary Variable is similar to list variable wherein we pass the index as an argument; however, in case of dictionary variable, we can store the details – key value form. It becomes easier to refer when used in the test case instead of using the index as 0, 1, etc.

### Syntax

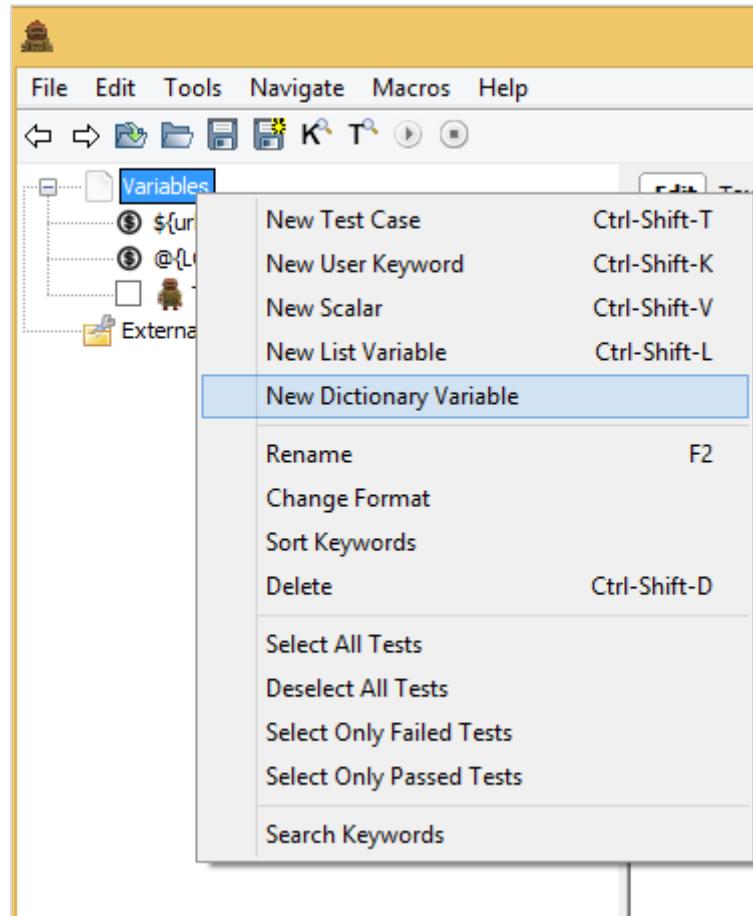

```
&{VARIABLENAME}
```

Suppose we are storing the values as key1=A, key2=B. It will be referred in the test case as :

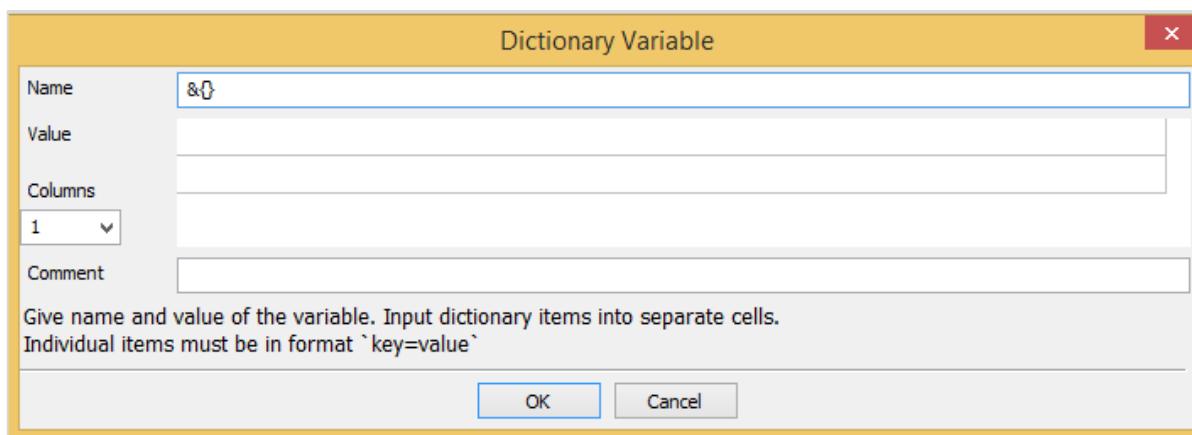

```
&{VariableName}[key1] // A  
&{VariableName}[key2] // B
```

Let us create dictionary variable in Ride.

Right-click on Project and click on *New Dictionary Variable*.

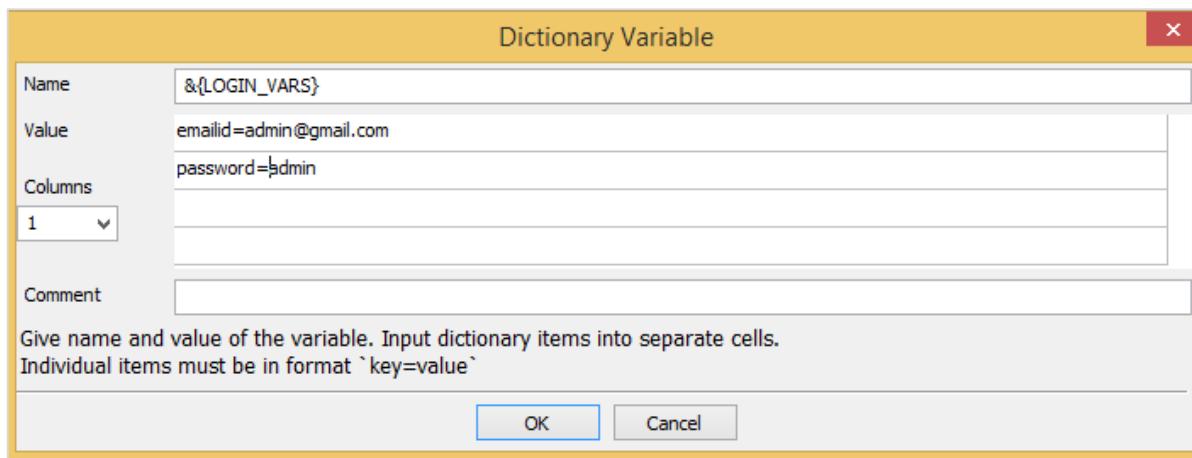

Upon clicking **New Dictionary Variable**, a screen will appear as shown below:

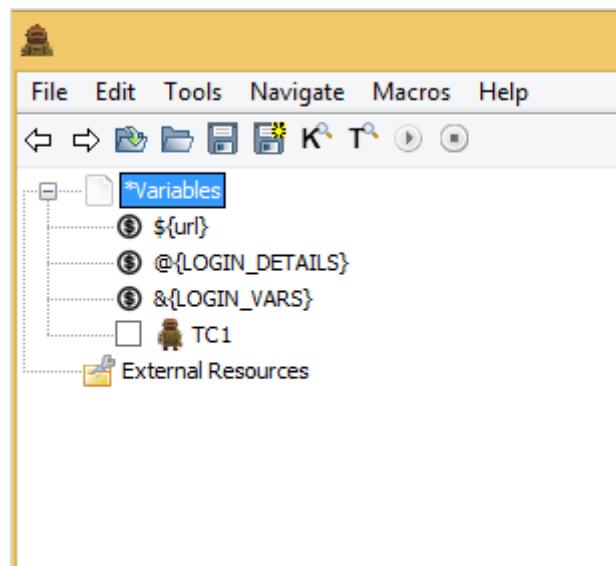

The Name by default in the screen is **&{ }** and it has Value and Columns option.

We will enter the Name and the Values to be used in the test case.

Click OK to save the variable. The variable will be listed under the project and also in the settings as follows:

Edit Text Edit Run

### Variables

Source C:\robotframework\variables.robot

Settings >>

Import	Name / Path	Arguments	Comment
Library	SeleniumLibrary		

Variable	Value	Comment
\${url}	http://localhost/robotframework/login.html	# this variable is used to store the value of the url.
@{LOGIN_DETAILS}	admin@gmail.com   admin	# emailid and password
&{LOGIN_VARS}	emailid=admin@gmail.com   password=admin	

We will change the test case to take the dictionary values.

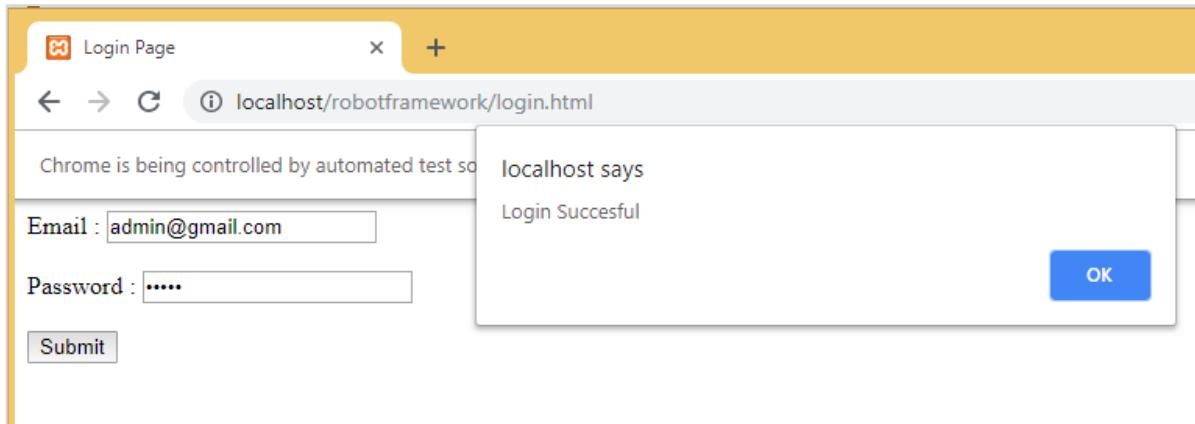

1	Open Browser	`\${url}`	chrome		
2	Input Text	id:email	@{LOGIN_DETAILS}[0]		
3	Input Password	id:passwd	@{LOGIN_DETAILS}[1]		
4	Click Button	id:btsnsubmit			
5					

We will change to dictionary variable as shown below.

## Using Dictionary Variable

1	Open Browser	<code>#{url}</code>	chrome		
2	Input Text	<code>id:email</code>	<code>&amp;{LOGIN_VARS}[emailid]</code>		
3	Input Password	<code>id:passwd</code>	<code>&amp;{LOGIN_VARS}[password]</code>		
4	Click Button	<code>id:btbsubmit</code>			
5					

Upon clicking run, we get the following:

The execution details are as follows:

```

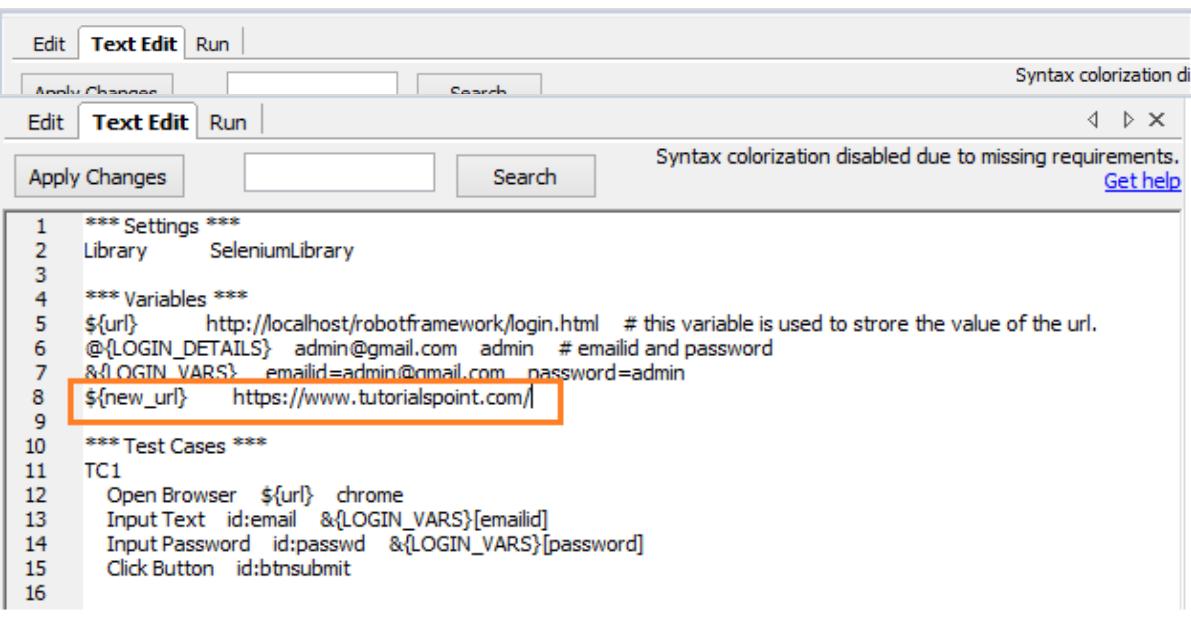

Edit | Text Edit | Run
Execution Profile: pybot
Arguments:
Elapsed time: 0:00:09 pass: 0 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDE5y_mcs.d\argfile.txt --listener C
unable to open socket to "localhost:49487" error: [Errno 10061] No connection could be made because the t
=====
Variables
=====
TC1 | PASS |
Variables
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDE5y_mcs.d\output.xml
Log:   c:\users\appdata\local\temp\RIDE5y_mcs.d\log.html

|
test finished 20181014 19:16:44
  
```

We have seen the Edit and Run Tab so far. In case of TextEdit, we have the details of the test case written. We can also add variables required in TextEdit.

## Test case

1	Open Browser	<code> \${url}</code>	chrome		
2	Input Text	<code> id:email</code>	<code>&amp;{LOGIN_VARS}[emailid]</code>		
3	Input Password	<code> id:passwd</code>	<code>&amp;{LOGIN_VARS}[password]</code>		
4	Click Button	<code> id:btnsubmit</code>			

We have used scalar variable and dictionary variable in the above test case. Here is the code so far in TextEdit; this is based on the test case written:

```

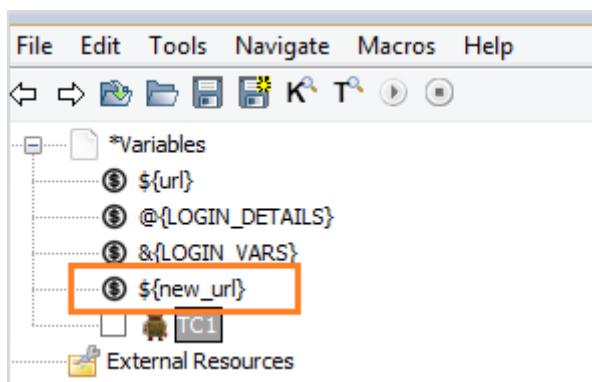

1  *** Settings ***
2  Library    SeleniumLibrary
3
4  *** Variables ***
5  ${url}      http://localhost/robotframework/login.html # this variable is used to store the value of the url.
6  @{LOGIN_DETAILS}  admin@gmail.com  admin # emailid and password
7  &{LOGIN_VARS}  emailid=admin@gmail.com  password=admin
8  ${new_url}    https://www.tutorialspoint.com/
9
10 *** Test Cases ***
11 TC1
12   Open Browser  ${url}  chrome
13   Input Text    id:email  &{LOGIN_VARS}[emailid]
14   Input Password  id:passwd  &{LOGIN_VARS}[password]
15   Click Button  id:btnsubmit
16

```

The variables used are highlighted in Red. We can also create variables we want directly in TextEdit as shown below:

We have added a scalar variable called  `${new_url}` and the value given is <https://www.tutorialspoint.com/>.

Click **Apply Changes** button on the top left corner and the variable will be seen under the project as shown below:

Similarly, other variables – list and dictionary variables can be created directly inside TextEdit tab whenever required.

## Conclusion

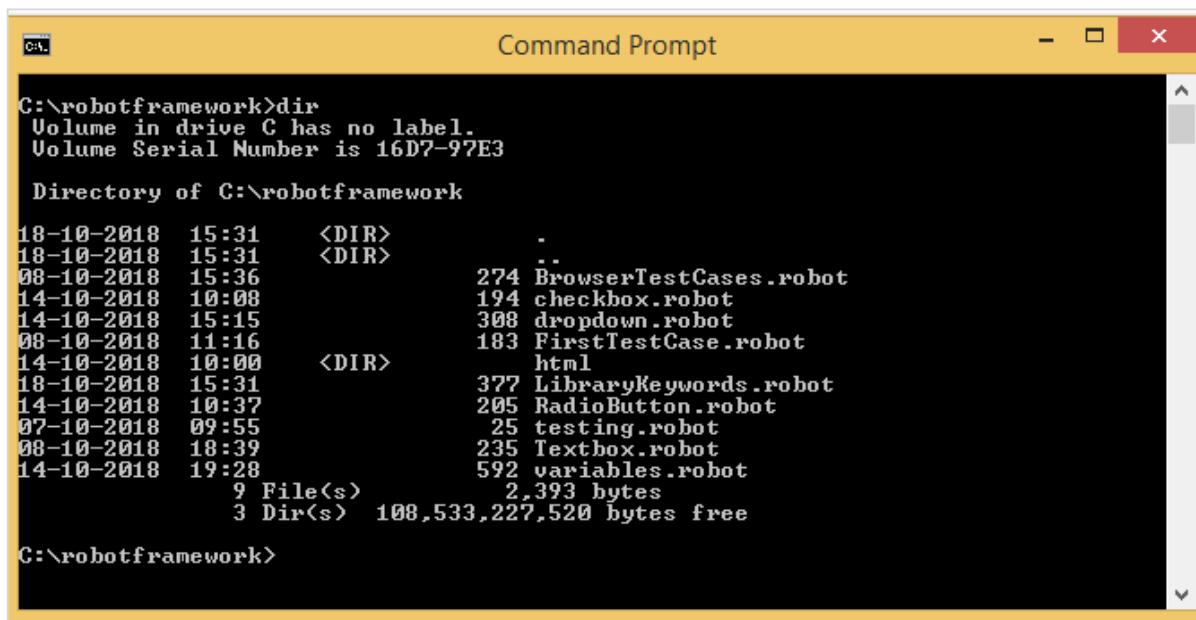

---

We have seen how to create and use variables. There are three types of variables supported in robot framework – scalar, list and dictionary. We discussed in detail the working of all these variables.

# 15. Robot Framework – Working With Command Line

In this chapter, we will learn how to make use of the command line to run test cases.

To begin with, let us open the command prompt and go to the folder where your test cases are saved. We have created test cases and saved in the folder **robotframework** in C Drive.

```
C:\robotframework>dir
 Volume in drive C has no label.
 Volume Serial Number is 16D7-97E3

Directory of C:\robotframework

18-10-2018  15:31    <DIR>          .
18-10-2018  15:31    <DIR>          ..
08-10-2018  15:36          274 BrowserTestCases.robot
14-10-2018  10:08          194 checkbox.robot
14-10-2018  15:15          308 dropdown.robot
08-10-2018  11:16          183 FirstTestCase.robot
14-10-2018  10:00    <DIR>          html
18-10-2018  15:31          377 LibraryKeywords.robot
14-10-2018  10:37          205 RadioButton.robot
07-10-2018  09:55          25 testing.robot
08-10-2018  18:39          235 Textbox.robot
14-10-2018  19:28          592 variables.robot
               9 File(s)      2,393 bytes
               3 Dir(s)   108,533,227,520 bytes free

C:\robotframework>
```

Test cases created so far are available in the folder **C:\robotframework**.

If you have saved your project as a file, the command is:

```
robot -T nameoftestcase.robot
```

If you have saved your project as a directory, the command is:

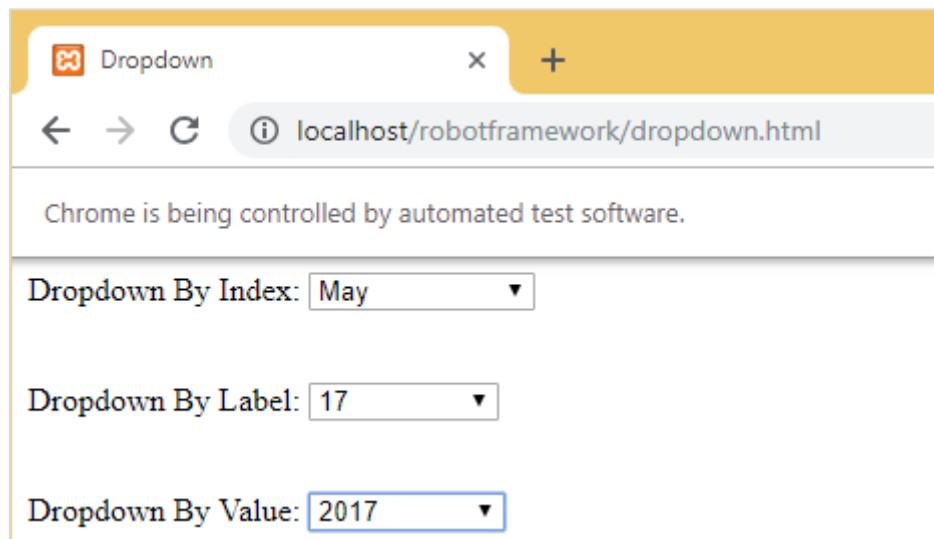

```
robot -T projectname testsuite
```

We will run one of the test created from the folder as shown below:

```
C:\robotframework>robot -T dropdown.robot
=====
Dropdown
=====

## Conclusion

---

We can use command line to execute robot test cases. The details of the test case pass or fail are displayed in the command line along with log and report URLs.

# 16. Robot Framework — Working With Setup And Teardown

In this chapter, we will understand two important concepts of testing world — setup and teardown.

## Setup

This is a set of keywords or instruction to be executed before the start of test suite or test case execution.

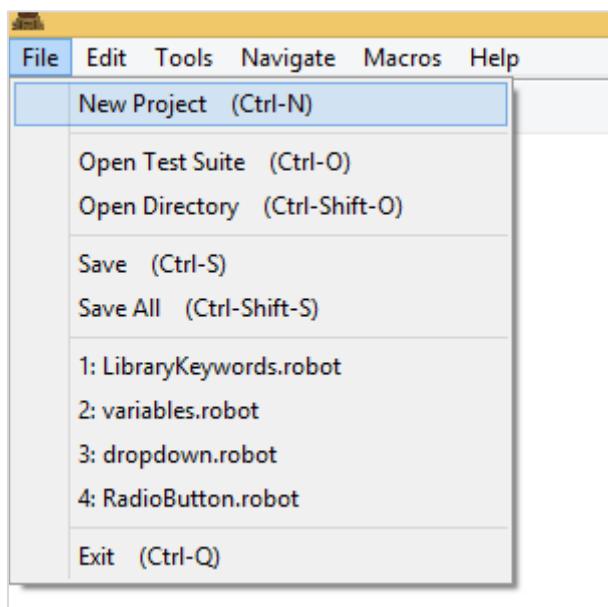

## Teardown

This is a set of keywords or instruction to be executed after the start of test suite or test case execution.

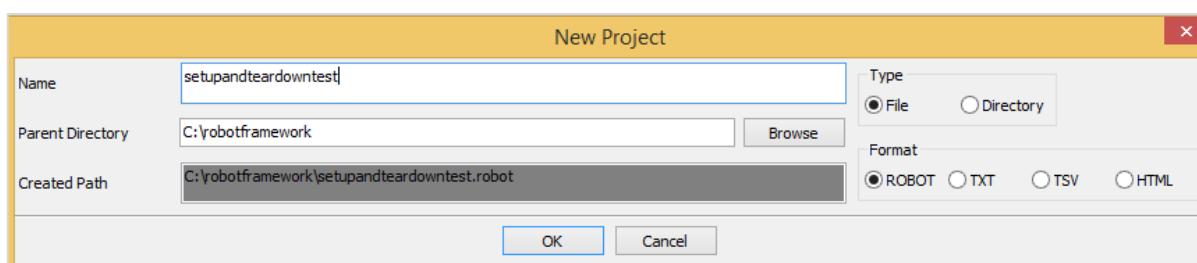

We will work on a project setup, where will use both setup and teardown. The opening and closing of browser are the common steps in test cases.

Now, we will add keyword **open browser** in the setup and close browser in teardown.

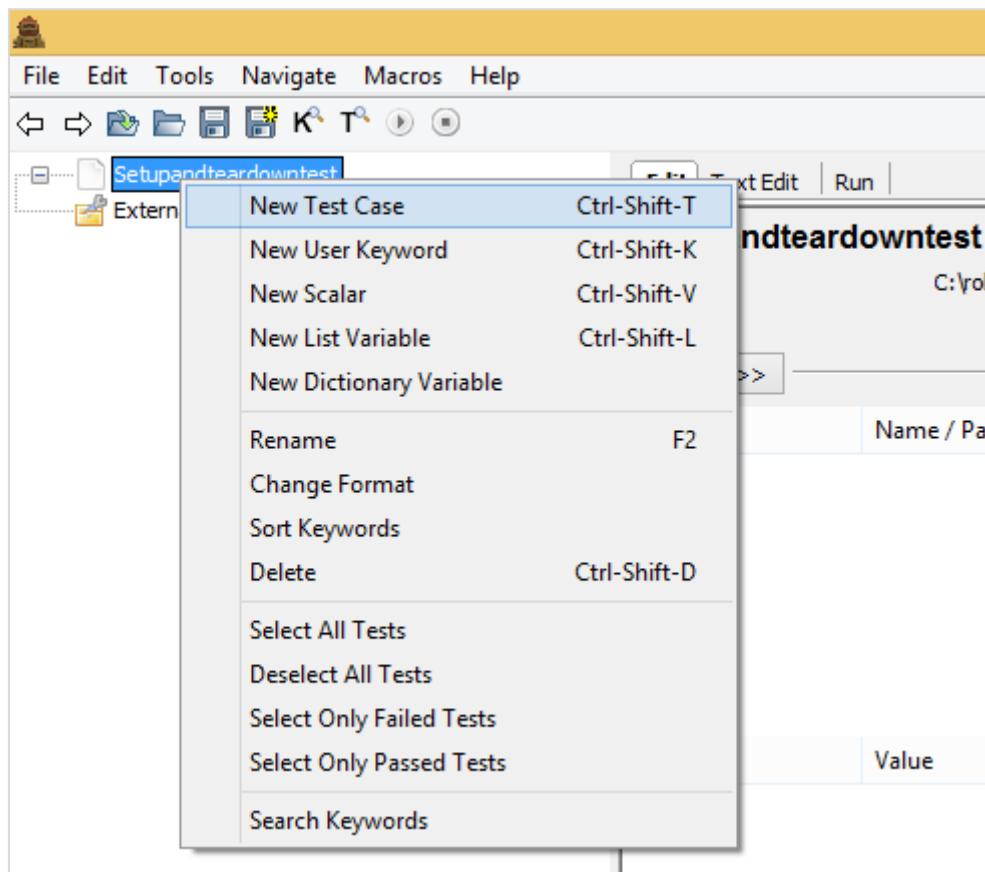

Open Ride using **ride.py** command from command line and create a new project.

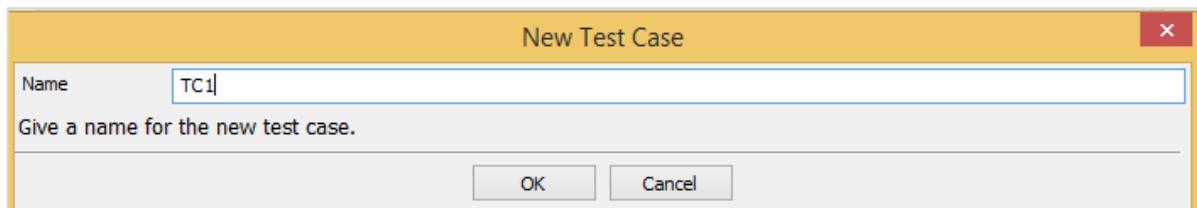

Click *New Project* to create project.

Click OK to save the project.

Click **New Test Case** to create one.

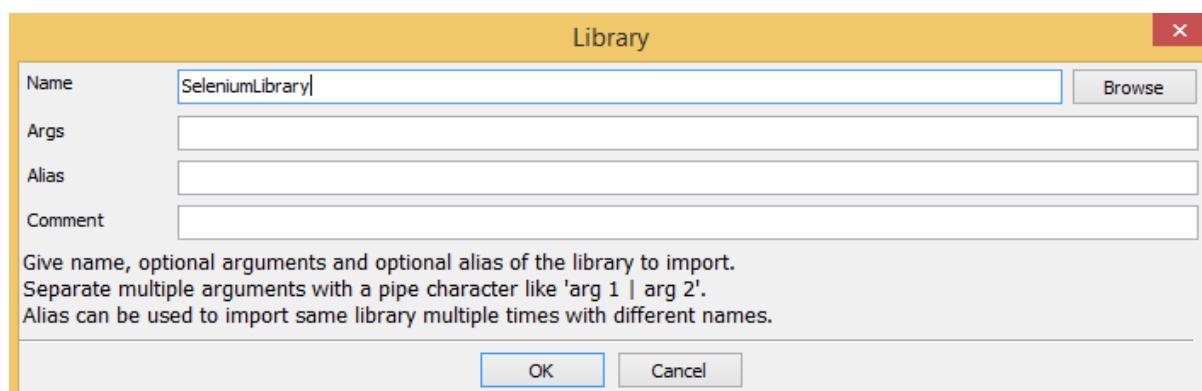

Click OK to save the test case.

Now we need to import the SeleniumLibrary to use the keywords related to browser and interact with the pages.

To import the library, click Library:

The screenshot shows the 'Setupandteardowntest' test case in the Robot Framework interface. A context menu is open over the 'Import' column, with 'Library' selected. Other options in the menu include 'Resource', 'Variables', 'Import Failed Help', 'Add Scalar', 'Add List', and 'Add Dict'.

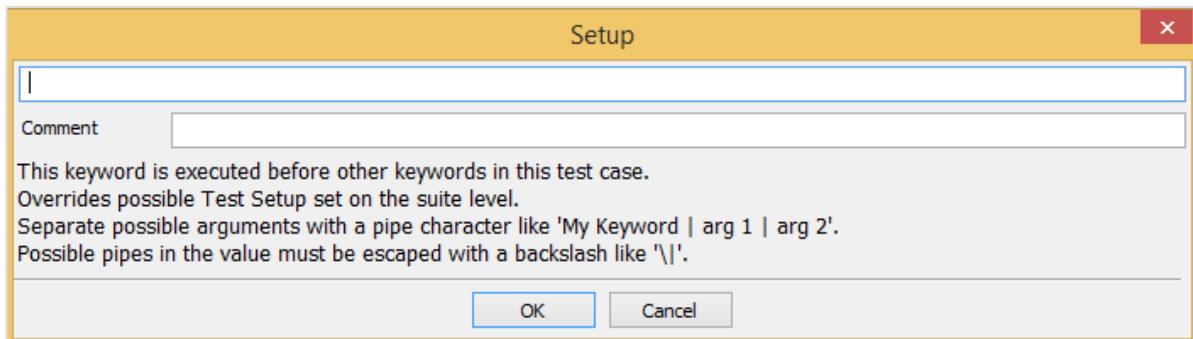

Click OK to save the library.

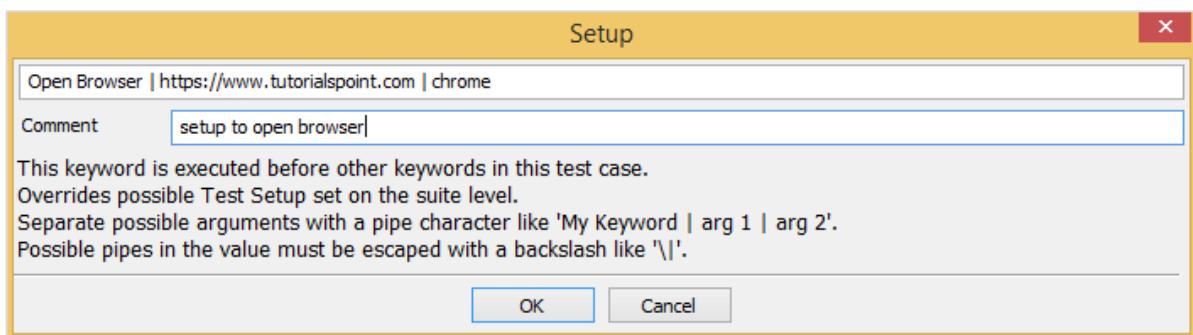

The screenshot shows the 'TC1' test case settings. The 'Setup' and 'Teardown' sections are highlighted with a red box. Other settings shown include 'Tags' (with a link to add new), 'Timeout', and 'Template'. A table below lists steps numbered 1 to 5.

In the above screenshot, the Settings section has *Setup and Teardown* options. For Setup, click **Edit** to enter the keyword.

Now, enter the Keyword:

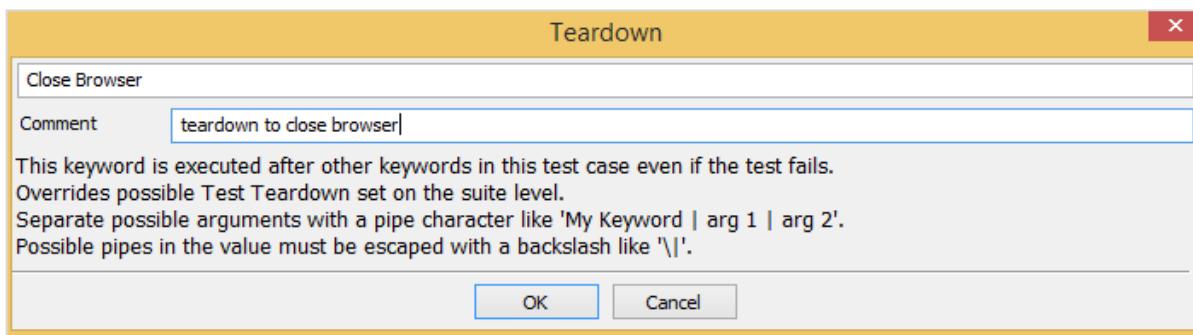

Arguments have to be separated with the pipe character (|).

Click OK to save the Setup. We have entered the Keyword **Open browser** and also added the arguments as shown above.

Now, we will enter the teardown case.

Click Edit for Teardown and enter the keyword.

Click OK to save the teardown.

Now, we will enter the keywords for test case.

The screenshot shows the 'TC1' test case configuration. Under 'Setup', there is a step: 'Open Browser | https://www.tutorialspoint.com | chrome | # setup to open browser'. Under 'Teardown', there is a step: 'Close Browser | # teardown to close browser'. The 'Tags' section contains '<Add New>'. The 'Input Text' table has one row with index 1, where the input is 'name=search' and the description is 'This is coming from setup/teardown testcase'. Buttons for 'Edit' and 'Clear' are available for each section.

We have only Input Text in the test case. The opening and closing of the browser is done from Setup and Teardown Settings.

## Test Execution Details

The screenshot shows the Pybot command-line interface. The 'Run' tab is selected. The command run was 'pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEid4bhi.d\argfile.txt --listener C:\Python27\lib\site-packages\rIDE\listener\html.py'. The output shows the test 'TC1' passed. The log includes details about the browser setup, the search input, and the test results. The report path is 'c:\users\appdata\local\temp\RIDEid4bhi.d\report.html'.

```

Elapsed time: 0:00:29  pass: 1  fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEid4bhi.d\argfile.txt --listener C:\Python27\lib\site-packages\rIDE\listener\html.py

Ending test:   Setupandteardowntest.TC1

```

## Conclusion

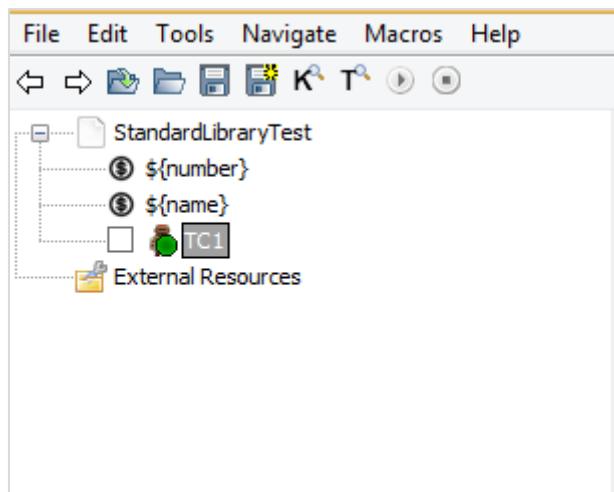

Setup and teardown play a crucial role in the testing world. We have seen how to use setup and teardown in our test cases and also how they are executed.

# 17. Robot Framework — Working with Built-In Library

In this chapter, we will cover some of the important built-in keywords, which come with the Robot Framework. We can use these keywords along with External libraries for writing test case. We also have the built-in library available with Robot framework by default. It is mostly used for verifications (for example – Should Be Equal, Should Contain), conversions (convert to integer, log to console, etc.).

We will work on a simple test case and will make use of built-in library in that.

We have created project in Ride and Test case as shown below:

We have created 2 scalar variables – number and name as shown below:

Variable	Value	Comment
\${number}	100	
\${name}	riya	

Here are the test cases used for comparing number, string, concatenate, etc. We have used simple keywords in the test cases below. The keywords are shown in tabular format here:

1	Log	Hello World			
2	Should Be True	\${number} == 100			
3	\${str1}	Catenate	Hello	World	
4	Log	\${str1}			
5	\${a}	Set Variable	Hi		
6	Log	\${a}			
7	\${b}	Set Variable If	\${number}>0	Yes	No
8	Log	\${b}			

Following is the test code for above test cases from text edit:

```

1 *** Variables ***
2 ${number}    100
3 ${name}     riya
4
5 *** Test Cases ***
6 TC1
7 Log Hello World
8 Should Be True ${number} == 100
9 ${str1} Catenate Hello World
10 Log ${str1}
11 ${a} Set Variable Hi
12 Log ${a}
13 ${b} Set Variable If ${number}>0 Yes No
14 Log ${b}
15

```

Now, we will execute the test case to see the results:

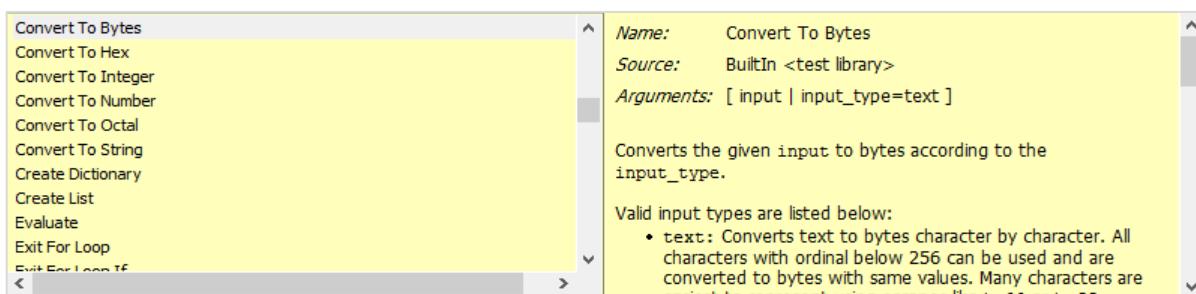

```

```

When you write your keywords in tabular format, press **ctrl + spacebar**. It gives the list of built-in keywords available with Robot Framework.

It gives the details of each keyword with example in the corresponding window. When we click on the corresponding window, it will open separately as shown below:

## Conclusion

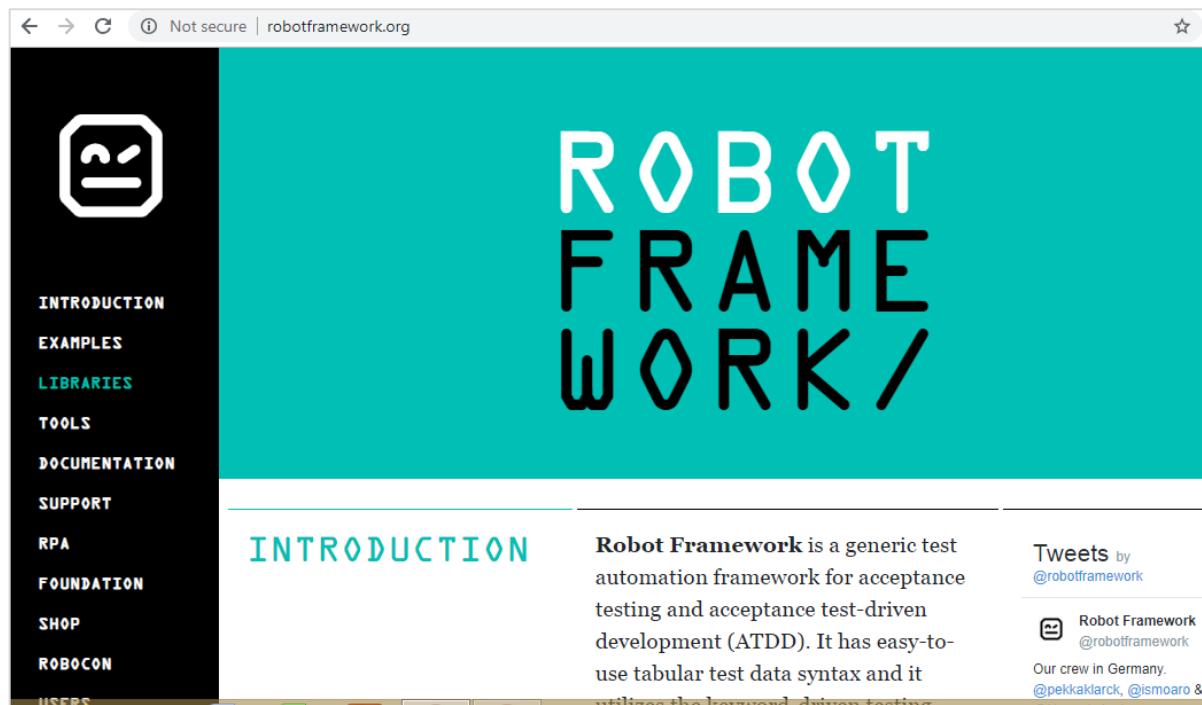

We have seen keywords related to string, numbers, log messages, which are available with robot framework by default. The same can be used along with external library and also can be used to create user-defined keyword to work with test-cases.

# 18. Robot Framework — Working With External Database libraries

We have seen how we can work with Selenium Library. The detailed installation/importing of Selenium Library is discussed in chapter “*Working with Browsers using Selenium Library*”.

In this chapter, we will discuss database library and how to connect and test database using Robot Framework.

Go to Robot framework site <http://robotframework.org/> and click **Libraries** as shown below:

Upon clicking Libraries, you will be redirected to a screen as shown below:

<b>LIBRARIES</b>		
<b>STANDARD</b>	<b>EXTERNAL</b>	<b>OTHER</b>
<b>Builtin</b> Provides a set of often needed generic keywords. Always automatically available without imports.	<b>Dialogs</b> Provides means for pausing the test execution and getting input from users.	<b>Collections</b> Provides a set of keywords for handling Python lists and dictionaries.
<b>OperatingSystem</b> Enables various operating system related tasks to be performed in the system where Robot Framework is running.	<b>Remote</b> Special library acting as a proxy between Robot Framework and test libraries elsewhere. Actual test libraries can be running on different machines and be implemented using	<b>Screenshot</b> Provides keywords to capture screenshots of the desktop.

The Libraries are categorized as Standard, External and Other.

We will now take a look at the external library in this chapter. Upon clicking External, the following screen appears:

<b>STANDARD</b>	<b>EXTERNAL</b>	<b>OTHER</b>
<b>Android library</b> Library for all your Android automation needs. It uses Calabash Android internally.	<b>AnywhereLibrary</b> Library for testing Single-Page Apps (SPA). Uses Selenium Webdriver and Appium internally.	<b>AppiumLibrary</b> Library for Android- and iOS-testing. It uses Appium internally.
<b>Archive library</b> Library for handling zip- and tar-archives.	<b>AutoItLibrary</b> Windows GUI testing library that uses AutoIt freeware tool as a driver.	<b>CncLibrary</b> Library for driving a CNC milling machine.
<b>Database Library (Java)</b> Java-based library for database testing. Usable with Jython. Available also at <a href="#">Maven central</a> .	<b>Database Library (Python)</b> Python based library for database testing. Works with any Python interpreter, including Jython.	<b>Debug Library</b> A debug library for RobotFramework, which can be used as an interactive shell(REPL) also.
<b>Diff Library</b> Library to diff two files together.	<b>Django Library</b> Library for <a href="#">Django</a> , a Python web framework.	<b>Eclipse Library</b> Library for testing Eclipse RCP applications using SWT widgets.
<b>robotframework-faker</b> Library for <a href="#">Faker</a> , a fake test data generator.	<b>FTP library</b> Library for testing and using FTP server with Robot Framework.	<b>HTTP library (livetest)</b> Library for HTTP level testing using livetest tool internally.

It shows the list of external libraries supported by Robot Framework. Here, we will focus more on the Database Library (Python). The same has been highlighted in the screenshot above.

Upon clicking the Database Library (Python), you will be redirected to the screen where the instruction for installation are listed as shown in the following screenshot:

franz-see.github.io/Robotframework-Database-Library/

## Install

Using easy\_install

```
easy_install robotframework-databaselibrary
```

Using pip

```
pip install -U robotframework-databaselibrary
```

From Source

Download source from <https://github.com/franz-see/Robotframework-Database-Library/archives/0.2>. Extract the tarball or the zip file then enter the extracted directory. Then run

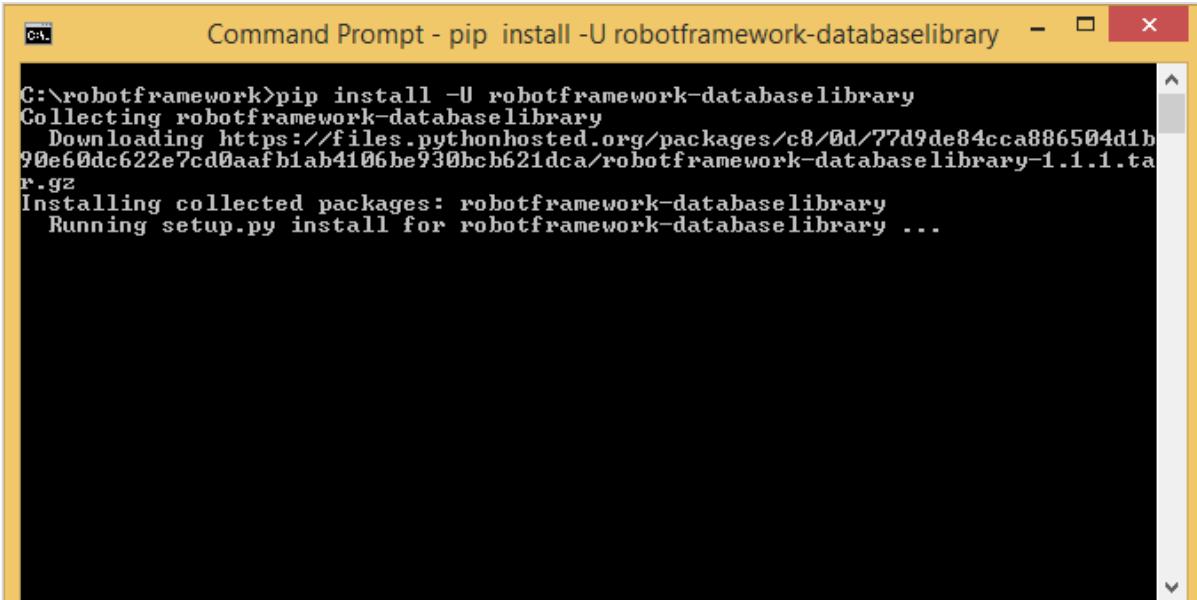

```
python setup.py install
```

## License

We can install the database library using pip and the command is:

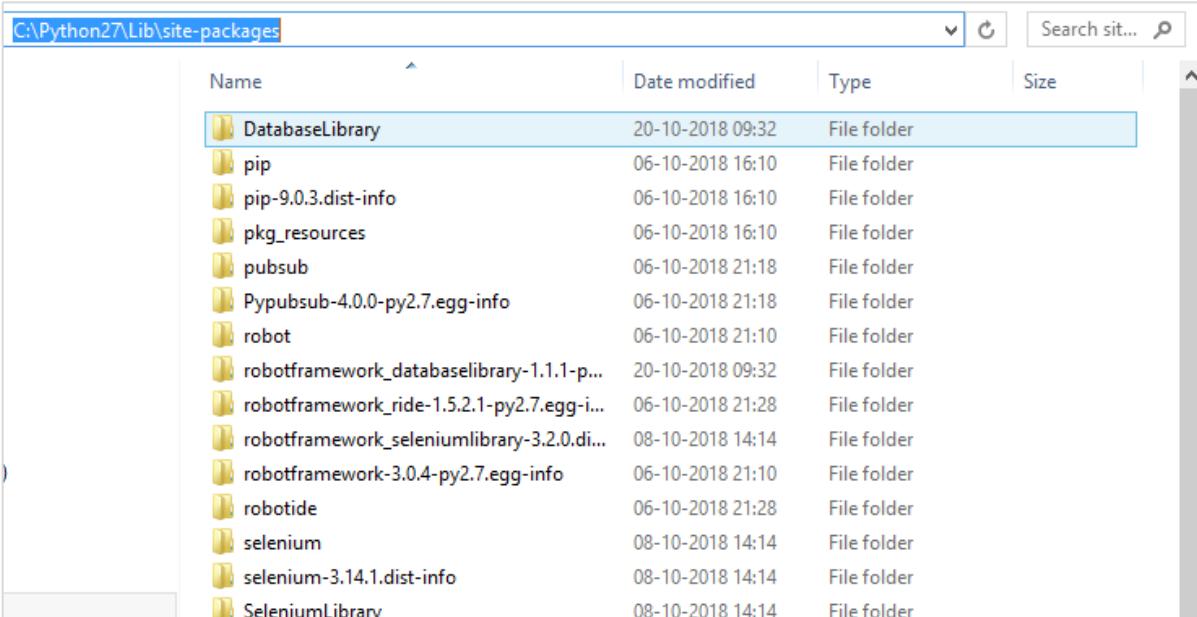

```
pip install -U robotframework-databaselibrary
```

Run the above command in the command line as shown below:

```
Command Prompt - pip install -U robotframework-databaselibrary
C:\robotframework>pip install -U robotframework-databaselibrary
Collecting robotframework-databaselibrary
  Downloading https://files.pythonhosted.org/packages/c8/0d/77d9de84cca886504d1b90e60dc622e7cd0aaafbiab4106be930bcb621dca/robotframework-databaselibrary-1.1.1.tar.gz
Installing collected packages: robotframework-databaselibrary
  Running setup.py install for robotframework-databaselibrary ...
```

The Library is stored in python lib folder as shown below:

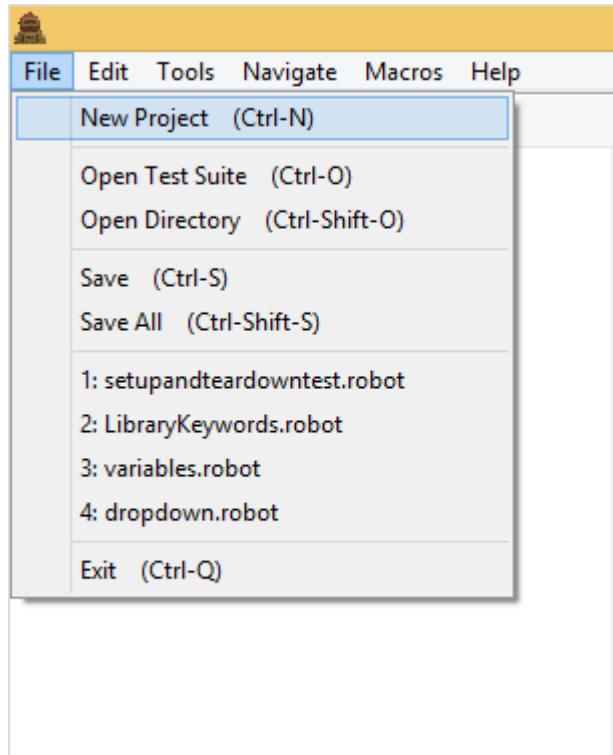

Name	Date modified	Type	Size
DatabaseLibrary	20-10-2018 09:32	File folder	
pip	06-10-2018 16:10	File folder	
pip-9.0.3.dist-info	06-10-2018 16:10	File folder	
pkg_resources	06-10-2018 16:10	File folder	
pubsub	06-10-2018 21:18	File folder	
Pypubsub-4.0.0-py2.7.egg-info	06-10-2018 21:18	File folder	
robot	06-10-2018 21:10	File folder	
robotframework_databaselibrary-1.1.1-p... ...	20-10-2018 09:32	File folder	
robotframework_ride-1.5.2.1-py2.7.egg-i... ...	06-10-2018 21:28	File folder	
robotframework_seleniumlibrary-3.2.0.di... ...	08-10-2018 14:14	File folder	
robotframework-3.0.4-py2.7.egg-info	06-10-2018 21:10	File folder	
robotide	06-10-2018 21:28	File folder	
selenium	08-10-2018 14:14	File folder	
selenium-3.14.1.dist-info	08-10-2018 14:14	File folder	
SeleniumLibrary	08-10-2018 14:14	File folder	

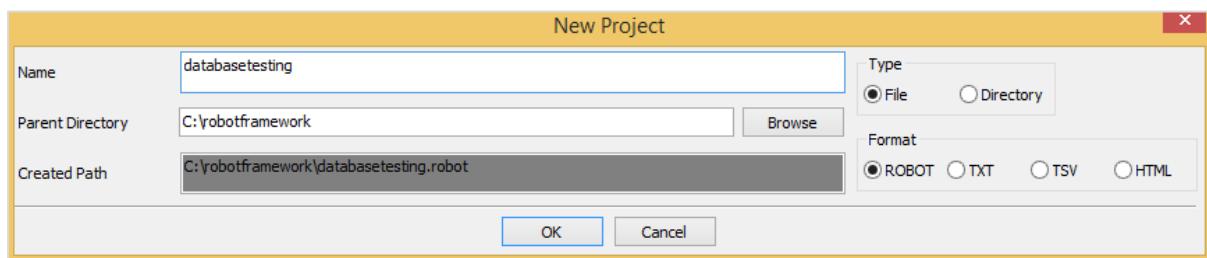

Once the installation is done, the next step is to import the library inside the project and use it with test cases.

## Import Database Library

Open ride using **ride.py** from command line and create the project for testing database.

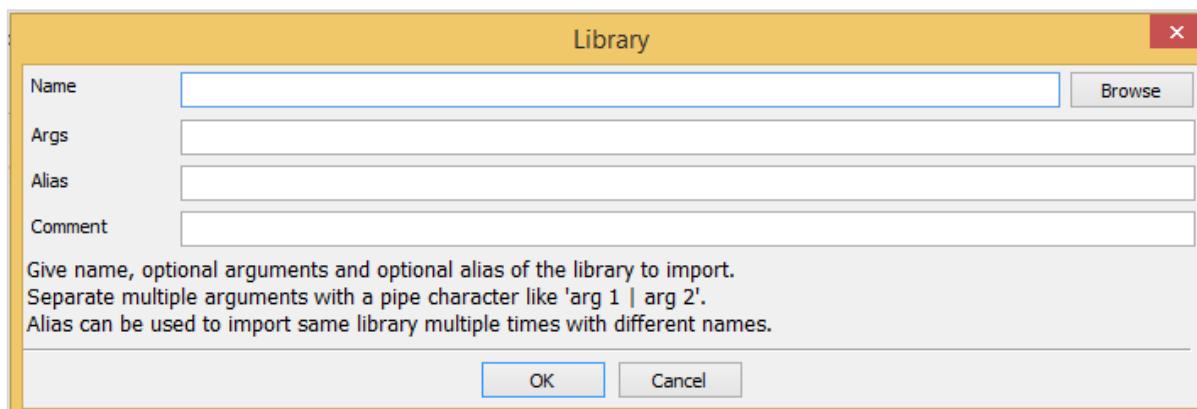

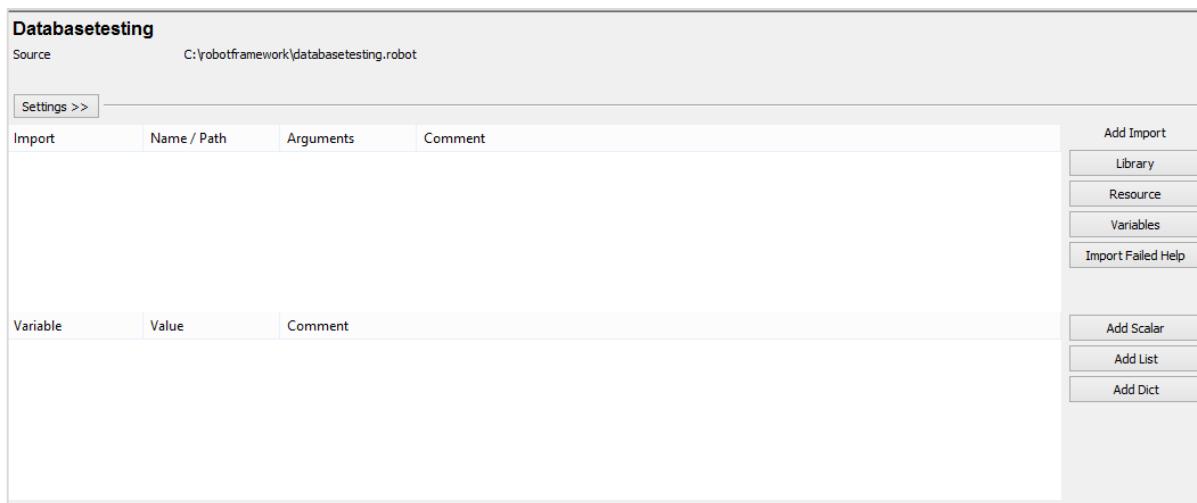

Click New Project and give a name to the project.

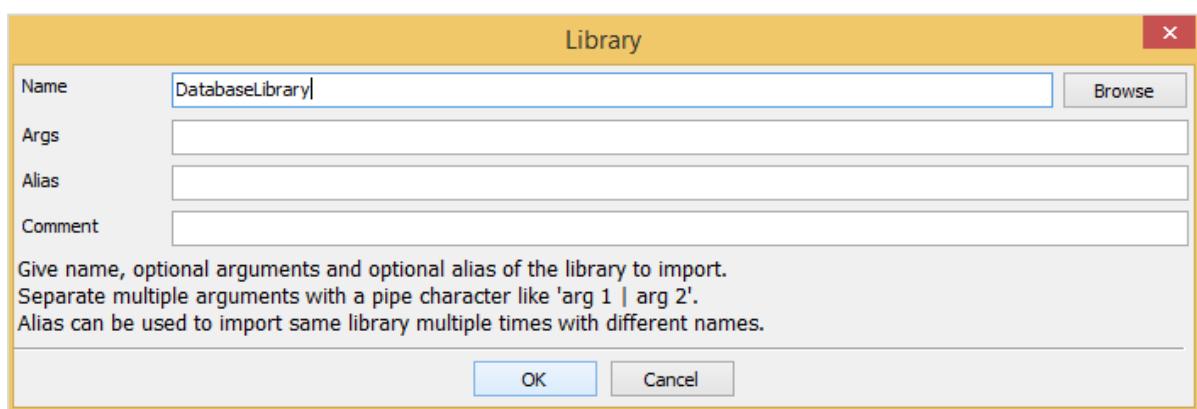

Click OK to save the project.

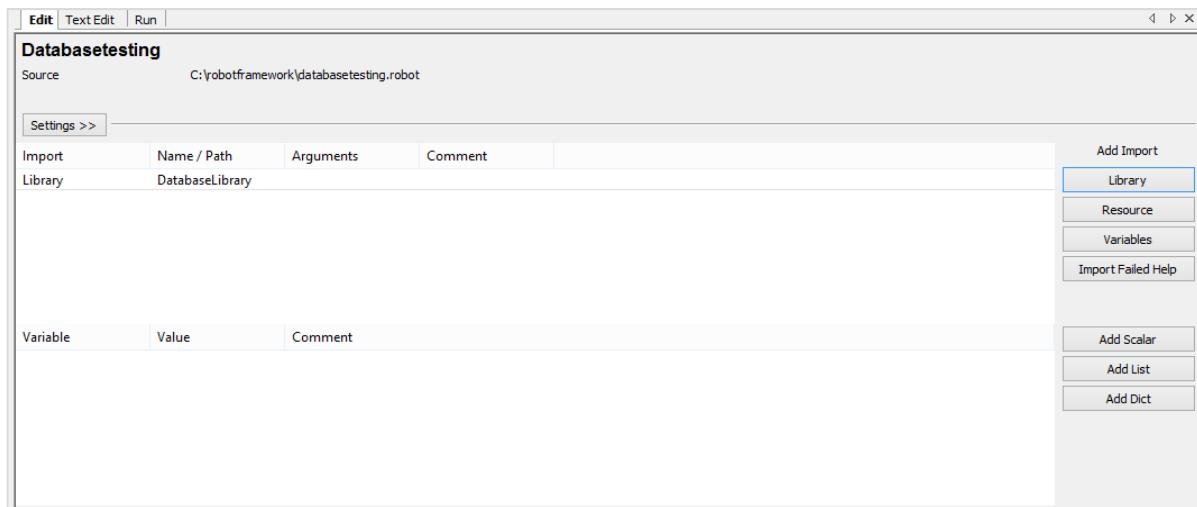

Click Library below Add Import.

Enter the Name of the Library as DatabaseLibrary as shown below and click OK.

Once saved, the library is as shown below:

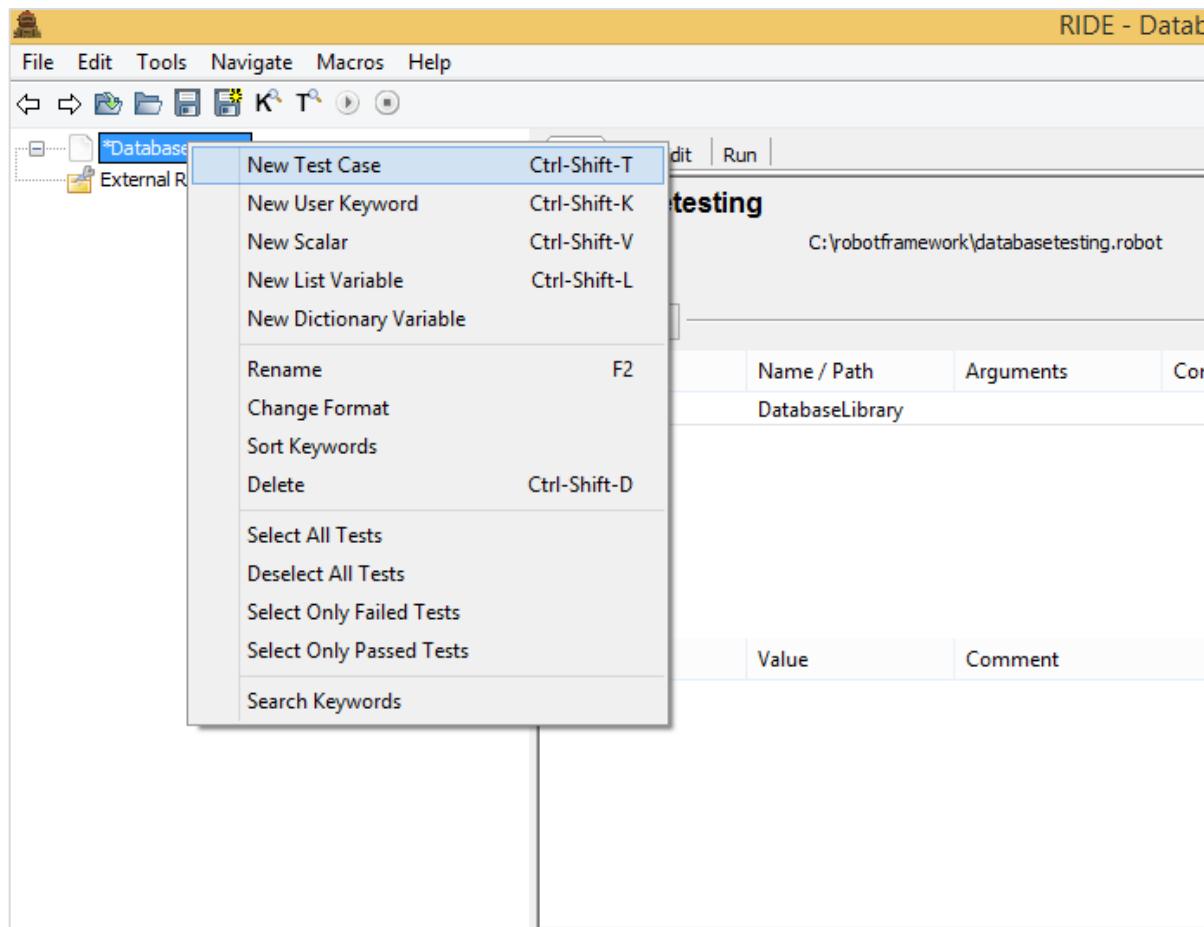

We are going to work with MySQL Database. To work with MySQL, we need to install the module.

## Command

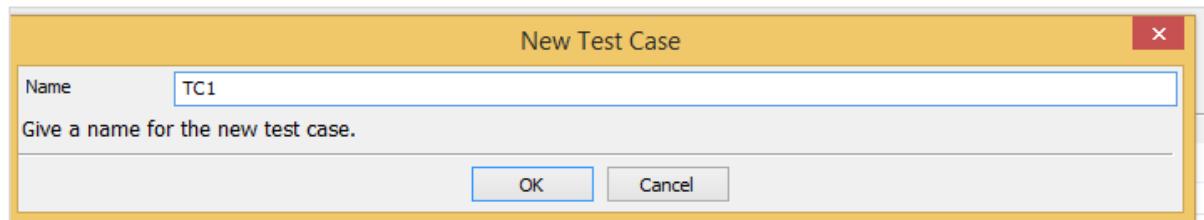

```
pip install pymysql
```

```
C:\robotframework>pip install pymysql
Collecting pymysql
  Downloading https://files.pythonhosted.org/packages/a7/7d/682c4a7da195a678047c8f1c51bb7682aaedee1dca7547883c3993ca9282/PyMySQL-0.9.2-py2.py3-none-any.whl (47kB)
    100% :#####: 51kB 527kB/s
Collecting cryptography (from pymysql)
-
```

Now create test case under the project created.

Click New Test Case:

Enter the name of the test case and click OK.

We are going to use the existing database called *customers* available with us.

We will use phmyadmin to show the customer database:

The screenshot shows the PhMyAdmin interface for a MySQL database named 'customers'. The 'customer' table is selected. The table has columns: customer\_id, customer\_name, customer\_email, and status. There are 6 rows of data:

	customer_id	customer_name	customer_email	status
1	1	Jacob_William	jacob@gmail.com	1
2	2	ssa	ss@gmail.com	1
3	3	Aadarsh	aadarsh@gmail.com	1
4	4	Aadhik Singh	aadhik@gmail.com	1
5	5	Nidhi Singh	nidhi@gmail.com	0
6	6	Siddi_Agarwal	siddi@gmail.com	0

We have a table called customer, which has data distributed in 6 rows. Now will write test-case which will connect to MySQL database customers and fetch the data from customer table.

Before we start, we will create scalar variables which will hold the data for dbname, dbuser, dbpasswd, dbhost, dbport and queryresult to store data, etc. Here are the variables created with values:

Variable	Value	Comment
\${dbname}	customers	
\${dbuser}	root	
\${dbpasswd}	admin	
\${dbhost}	localhost	
\${dbport}	3306	
@queryResults		

The command to connect to database is:

```
Connect To Database      pymysql      ${dbname}    ${dbuser}    ${dbpasswd}
${dbhost}    ${dbport}
```

1	Connect To Database	pymysql	\${dbname}	\${dbuser}	\${dbpasswd}	\${dbhost}	\${dbport}
2							
3							
4							
5							
6							

We will add some more test cases as shown below:

<b>1</b>	<b>Connect To Database</b>	pymysql	<code> \${dbname}</code>
<b>2</b>	<b>Table Must Exist</b>	customer	
<b>3</b>	<b>Check If Exists In Database</b>	<code>SELECT * FROM customer</code>	
<b>4</b>	<code>@{queryResults}</code>	<b>Query</b>	<code>SELECT * FROM customer</code>
<b>5</b>	<b>Log</b>	<code>@{queryResults}[0]</code>	
<b>6</b>			
<b>7</b>			
<b>8</b>			

Here are the details:

```
*** Settings ***
Library           DatabaseLibrary

*** Variables ***
${dbname}          customers
${dbuser}          root
${dbpasswd}        admin
${dbhost}          localhost
${dbport}          3306
@{queryResults}

*** Test Cases ***
TC1
    Connect To Database    pymysql    ${dbname}    ${dbuser}    ${dbpasswd}
    ${dbhost}    ${dbport}
    Table Must Exist    customer
    Check If Exists In Database    SELECT * FROM customer
    @{queryResults}    Query    SELECT * FROM customer
    Log    @{queryResults}[0]
```

We have connected to the database, checked if table customer exists in database, got the query executed and logged the details of the query.

We will execute the test case and see the output:

The screenshot shows the Robot Framework Test Runner window. The 'Run' tab is selected. In the arguments section, 'pybot' is chosen from the 'Execution Profile' dropdown. Below it, there are checkboxes for 'Only run tests with these tags' and 'Skip tests with these tags'. The main pane displays the test results and logs.

```

Elapsed time: 0:00:02 pass: 1 fail: 0

## Conclusion

We have seen how to import database library, and the installation of it. We now know how to connect to MySQL database in Robot Framework and test the tables.

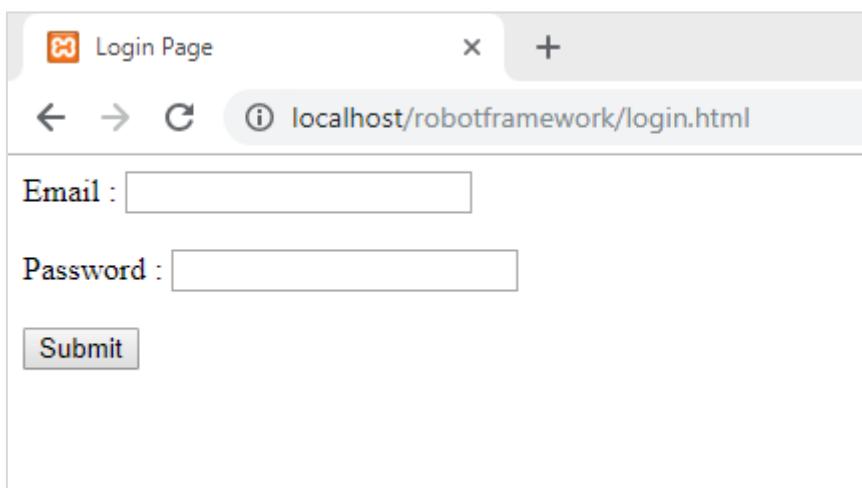

# 19. Robot Framework — Testing Login Page Using Robot Framework

With Robot Framework, we have learnt the following so far:

- Import Libraries
- Working with variables
- Create custom Keywords
- How to write test-cases
- How to create Setup and teardown
- How to execute test cases
- How to work with data driven test-cases

We will use all of the above features and use it to test login page in this chapter. We have a login page which takes in email-id and password. When you enter correct email id and password, you will be redirected to a welcome page. If the user enters invalid email id or password, the page will get redirected to error page.

The following screenshot shows a login page:

## HTML Code

```
<html>
<head>
<title>Login Page</title>
</head>
<body>
<script type="text/javascript">
function wsSubmit() {
```

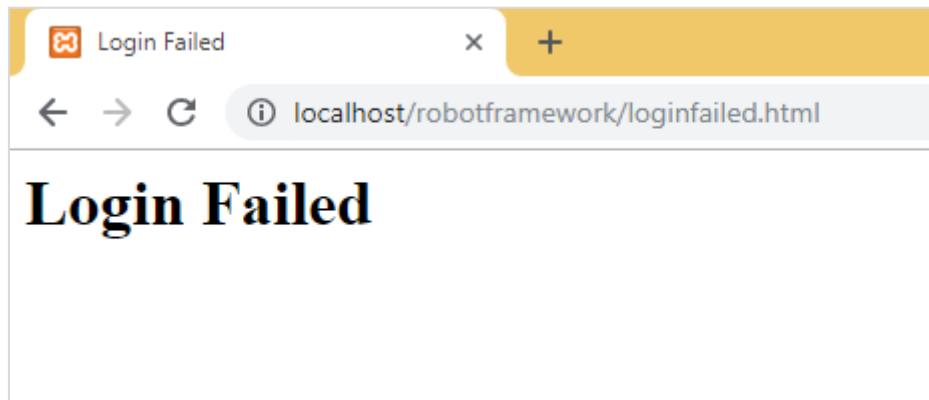

```

if (document.getElementById("email").value == "admin@gmail.com" &&
document.getElementById("passwd").value == "admin") {
    location.href = "http://localhost/robotframework/success.html";
} else {
    location.href = "http://localhost/robotframework/loginfailed.html";
}
}

</script>
<div id="formdet">
Email : <input type="text" id="email" value="" id="email" /><br/><br/>
Password : <input type="password" id="passwd" value="" /><br/><br/>
<input type="submit" id="btnsubmit" value="Submit" onClick="wsSubmit();"/>
</div>
</body>
</html>

```

The following screen appears when either the email-id or the password is not valid:

## HTML Code

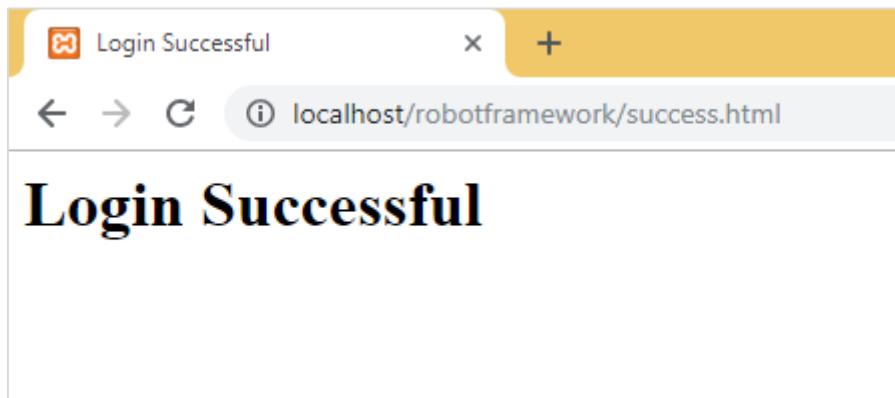

```

<html>
<head>
<title>Login Failed</title>
</head>
<body>
<div id="loginfailed">
<h1>Login Failed</h1>
</div>

```

```
</body>
</html>
```

The following screen appears when both the email id and password are valid:

## HTML Code

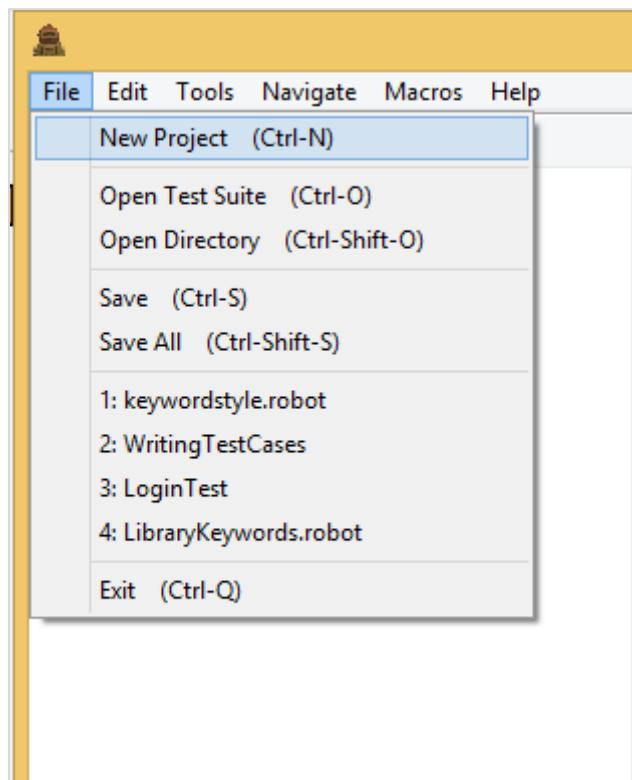

```
<html>
<head>
<title>Login Successful</title>
</head>
<body>
<div id="loginfail">
<h1>Login Successful</h1>
</div>
</body>
</html>
```

Now we are going to write test cases for the above test page. To start with it, we will first run the command to open Ride.

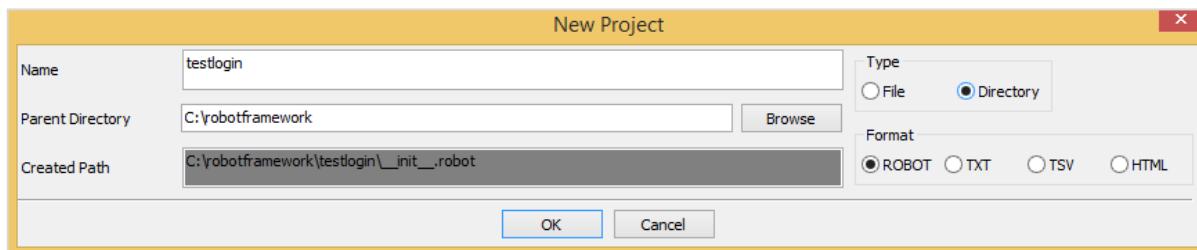

## Command

```
ride.py
```

Once done, we will get started with the project setup as shown below:

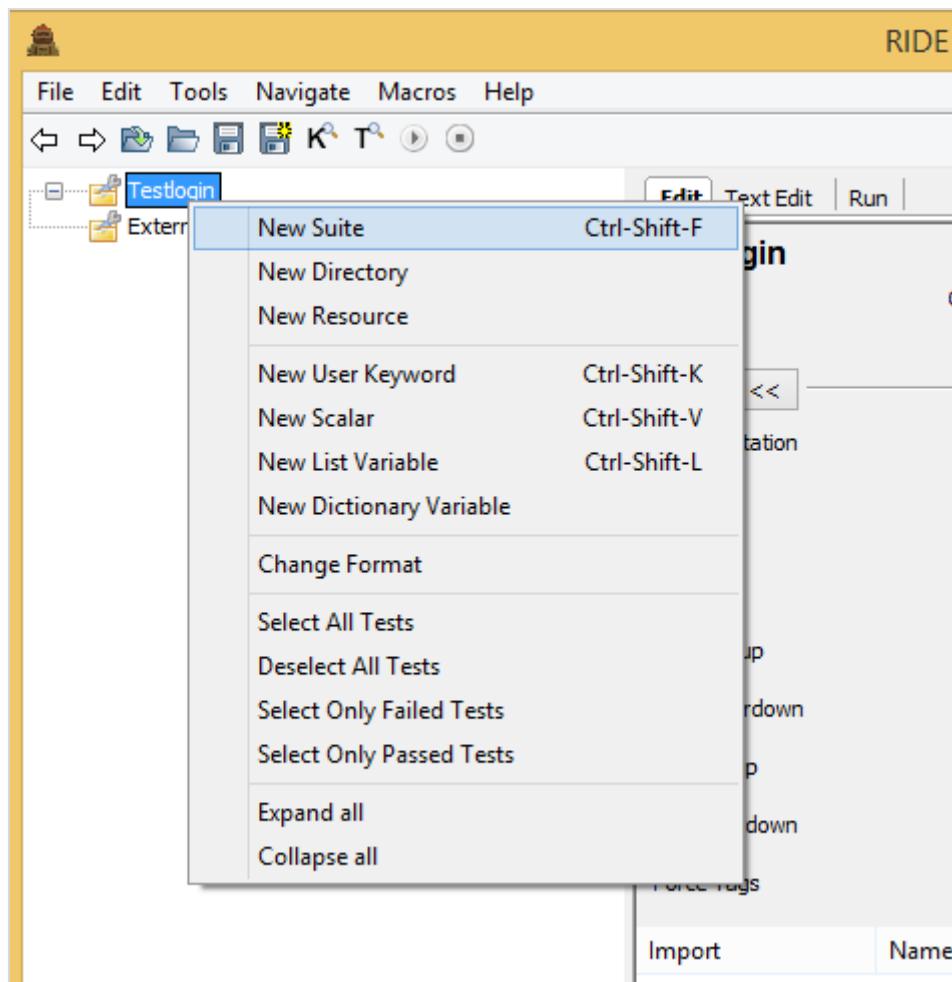

Click New Project and enter the name of the project.

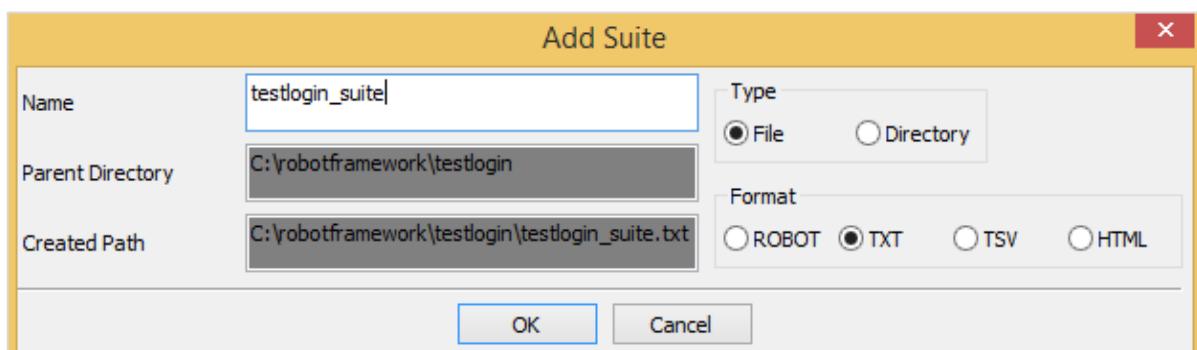

We will save the type of the project as Directory. The name given to the project is testlogin.

Click OK to save the project.

Now, we will create test suite inside the project.

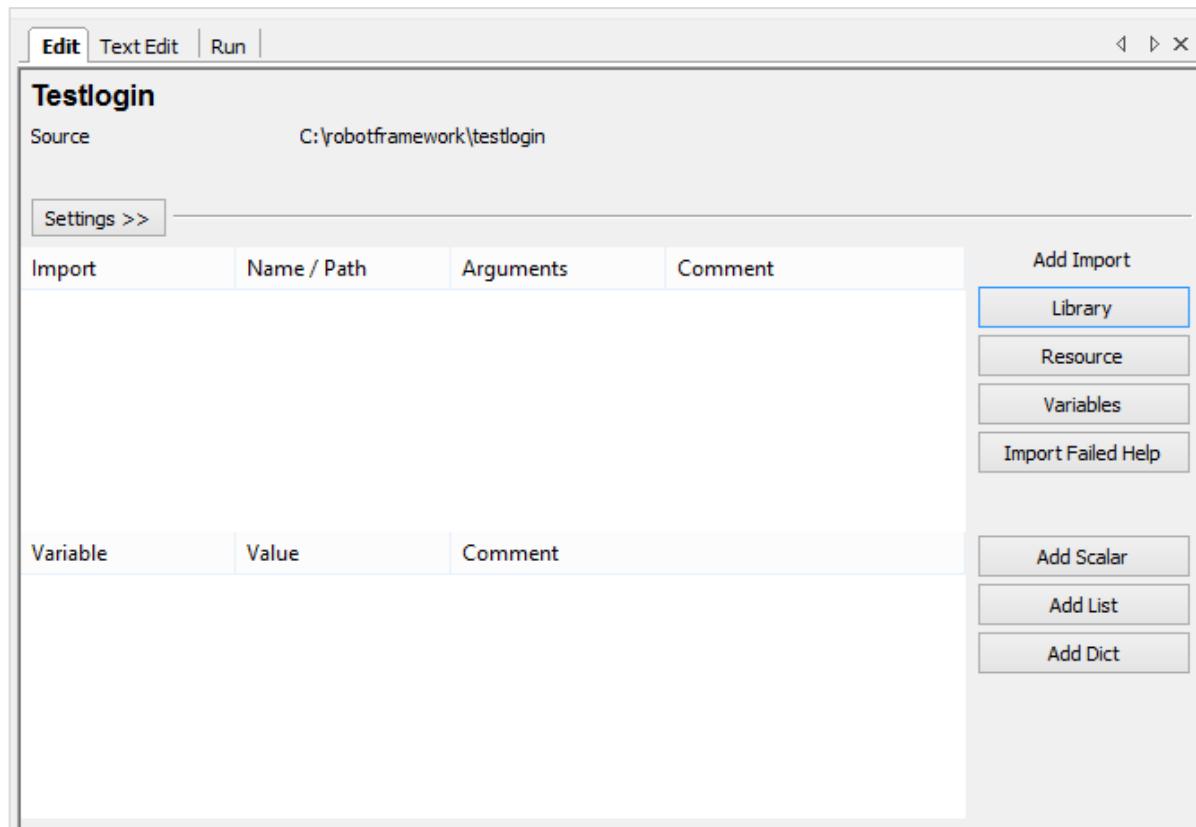

Click New Suite and it will display a screen as shown below:

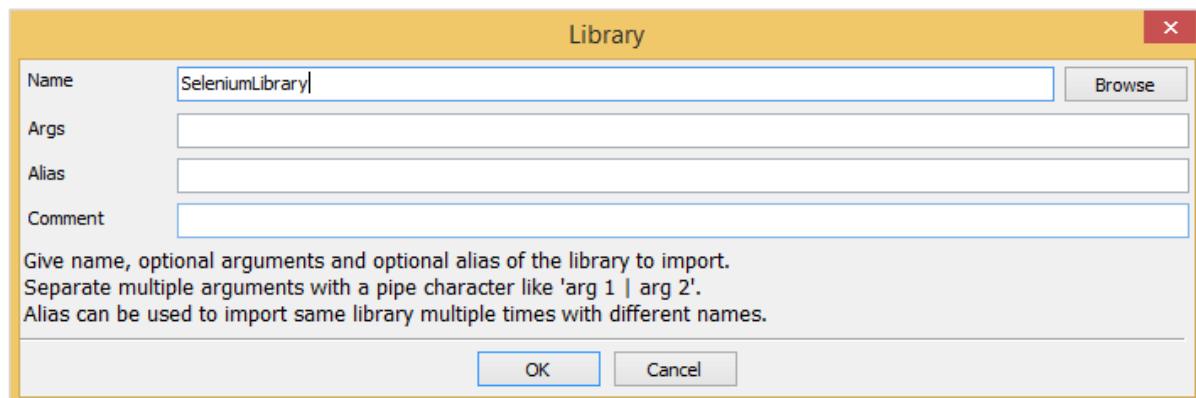

Click OK to save the test suite. We need to import the Selenium Library since we will be working with the browser.

Import Library in the main project and also to the test suite created.

Click Library as in the above screenshot. Upon clicking Library, the following screen will appear.

Click OK to save the library for the project.

Once the library is saved for the project, it will display the library in the settings:

The screenshot shows the 'Testlogin' library settings in the Robot Framework interface. The 'Source' field is set to 'C:\robotframework\testlogin'. A 'Settings >>' button is visible. The 'Import' table has one row: 'Library' imported from 'SeleniumLibrary'. To the right of the table is a context menu with buttons for 'Add Import' (highlighted), 'Library', 'Resource', 'Variables', and 'Import Failed Help'. Below the table is another context menu with buttons for 'Add Scalar', 'Add List', and 'Add Dict'.

Import	Name / Path	Arguments	Comment	Add Import
Library	SeleniumLibrary			Library Resource Variables Import Failed Help

Variable	Value	Comment	Add Scalar Add List Add Dict

Repeat the same step for the Test suite created.

Here is the library added for Test suite:

The screenshot shows the 'Testlogin Suite' test suite settings in the Robot Framework interface. The 'Source' field is set to 'C:\robotframework\testlogin\testlogin\_suite.txt'. A 'Settings >>' button is visible. The 'Import' table has one row: 'Library' imported from 'SeleniumLibrary'. To the right of the table is a context menu with buttons for 'Add Import' (highlighted), 'Library', 'Resource', 'Variables', and 'Import Failed Help'. Below the table is another context menu with buttons for 'Add Scalar', 'Add List', and 'Add Dict'.

Import	Name / Path	Arguments	Comment	Add Import
Library	SeleniumLibrary			Library Resource Variables Import Failed Help

Variable	Value	Comment	Add Scalar Add List Add Dict

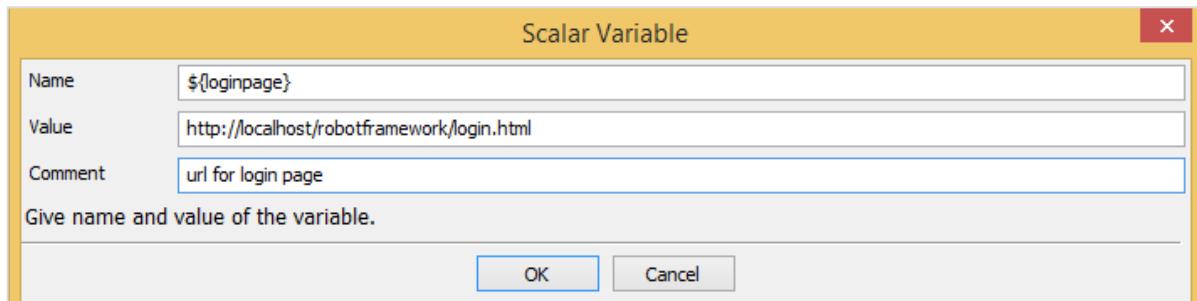

Now in the main Project, we will create a setup and teardown. We would like to open the login page in Chrome browser and maximize the window. In teardown, we will close the browser.

For setup, we will create a user-defined keyword called **Open Login Page**. This keyword will take 2 arguments, login page URL and browser name.

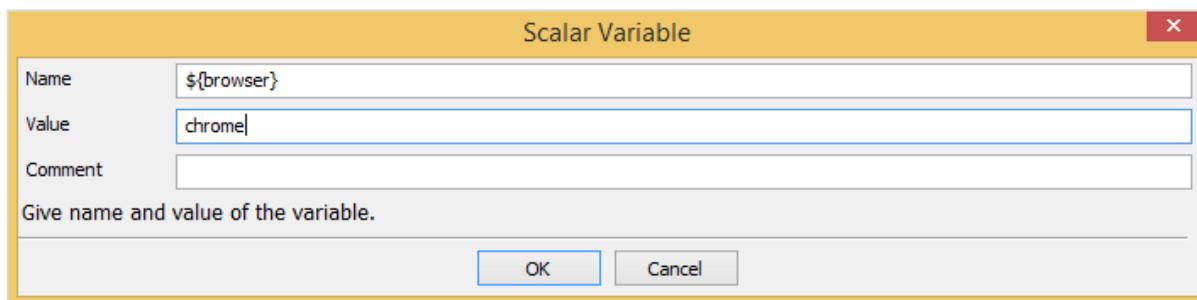

Now, we need 2 scalar variables that will help us store the values – url and the browser name.

In ride, create 2 variables  **`${loginpage}`** and  **`${browser}`** as follows:

**`${loginpage}`**

**`${browser}`**

Save both variables.

The variables will be displayed under your project as follows:

The screenshot shows the 'Testlogin' project structure on the left. In the main pane, under 'Settings >>', there is a table for variables:

Variable	Value	Comment
<code>\$(loginpage)</code>	<code>http://localhost/robotframework/login.html</code>	# url for login page
<code>\$(browser)</code>	<code>chrome</code>	

Now, we will add the setup and teardown for the main project.

Click on the project on the left side. In settings, click Suite Setup.

The screenshot shows the 'Testlogin' project structure on the left. In the main pane, under 'Settings <<', there is a section for suite setup:

Suite Setup	<input type="text"/>	Edit	Clear
Suite Teardown	<input type="text"/>	Edit	Clear
Test Setup	<input type="text"/>	Edit	Clear
Test Teardown	<input type="text"/>	Edit	Clear
Force Tags	<input type="text"/> <Add New>	Edit	Clear

The screenshot shows the 'Suite Setup' dialog box. It contains the following fields:

- Open Login Page | `$(loginpage}` | `$(browser}`
- Comment: setup to open login page

This keyword is executed before executing any of the test cases or lower level suites. Separate possible arguments with a pipe character like 'My Keyword | arg 1 | arg 2'. Possible pipes in the value must be escaped with a backslash like '\\|'.

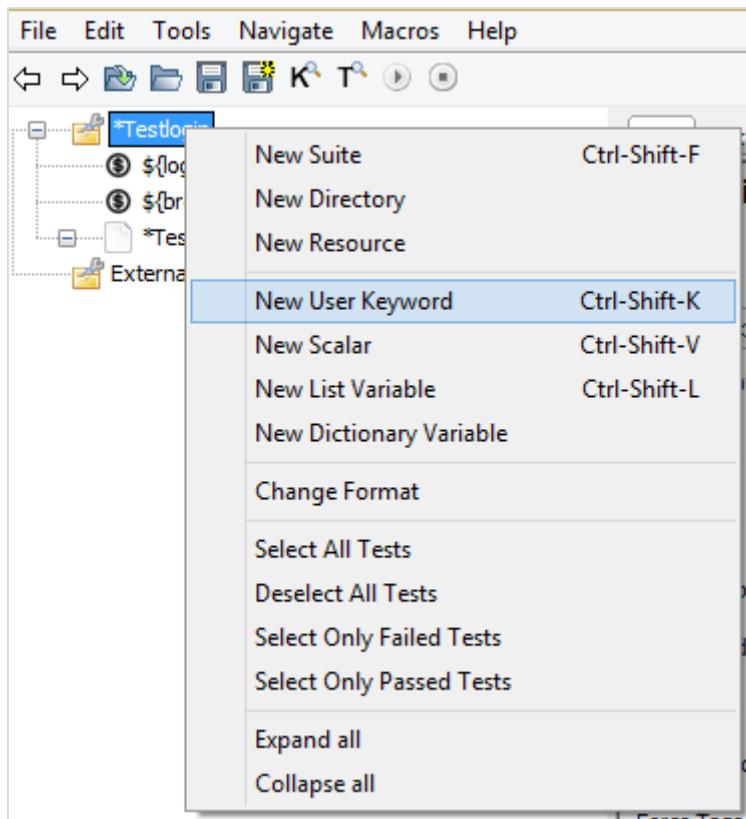

OK Cancel

We have created setup that is using user keyword **Open Login Page** with arguments  **\${loginpage}**  and  **\${browser}** .

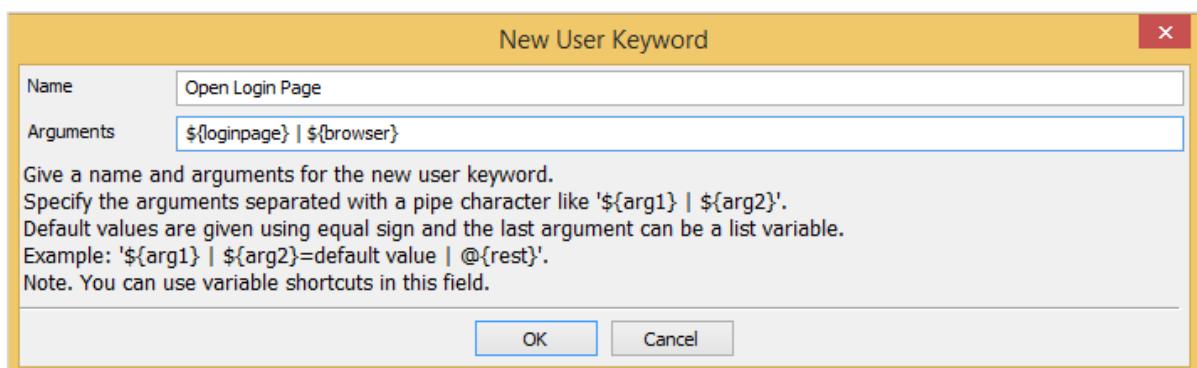

Click OK to save the setup.

Now, we have to create the user-defined keyword **Open Login Page**, which is done as follows:

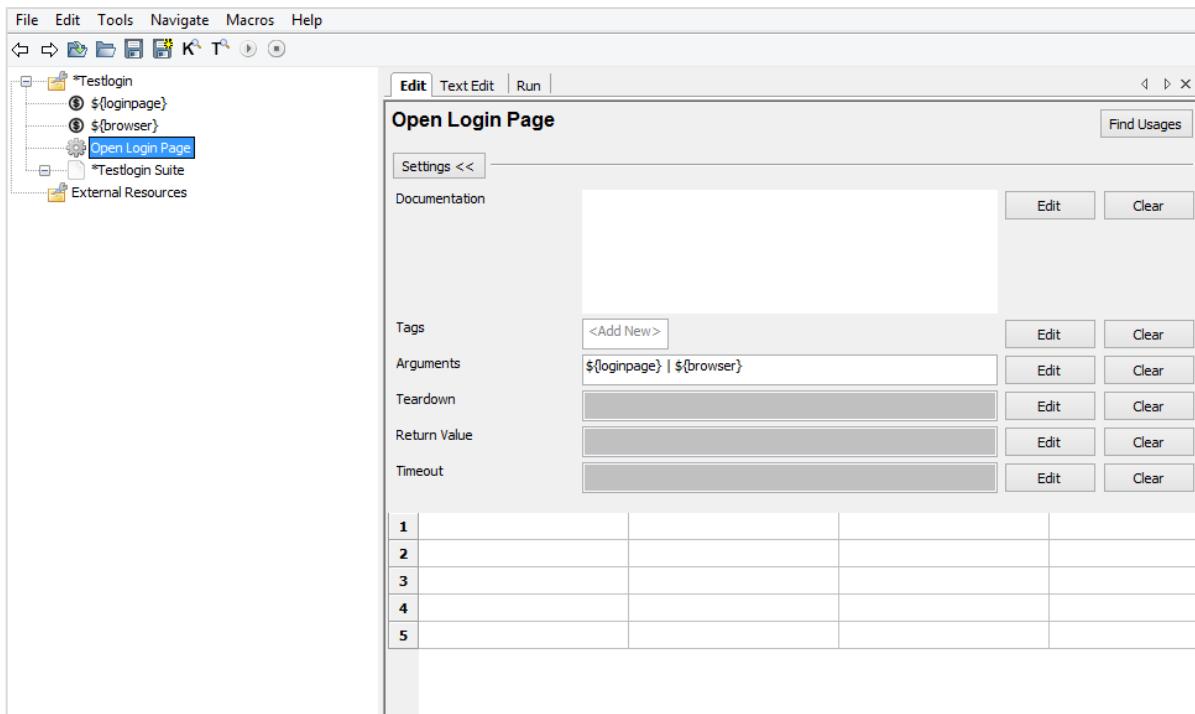

Right-click on the project and click **New User Keyword**:

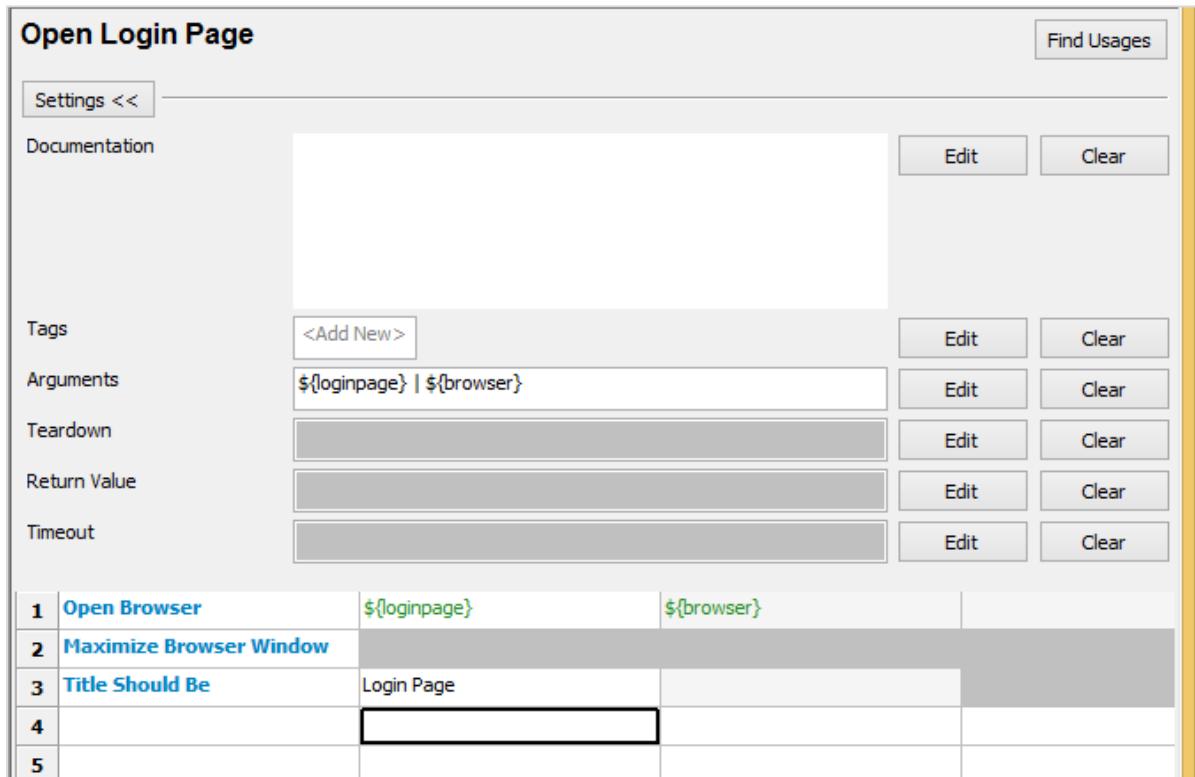

Upon clicking **New User Keyword**, the following screen appears:

Here the Keyword is given 2 arguments –  **\${loginpage}**  and  **\${browser}** . Click OK to save the user keyword.

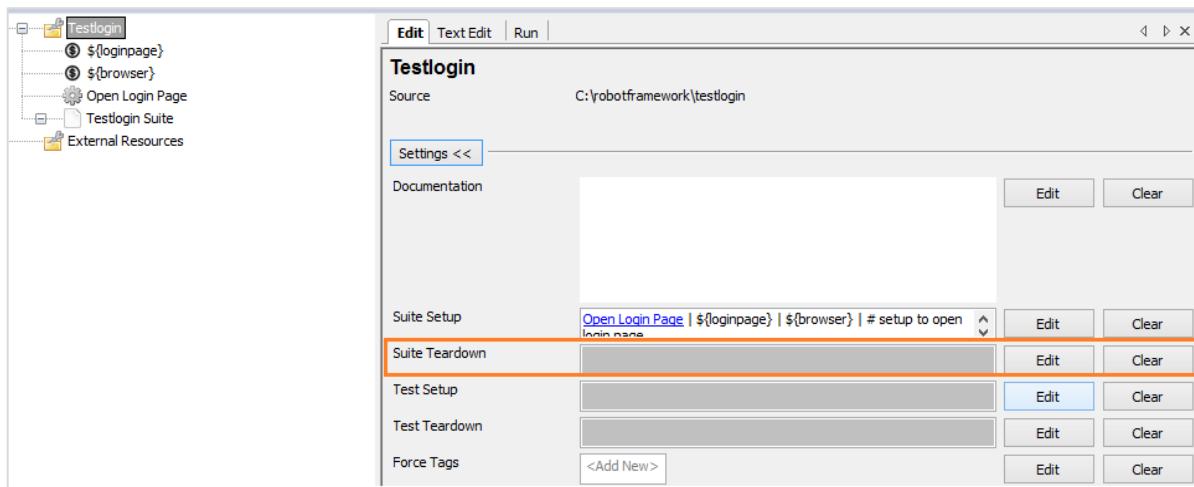

Now we need to enter the library keywords, which will open the URL.

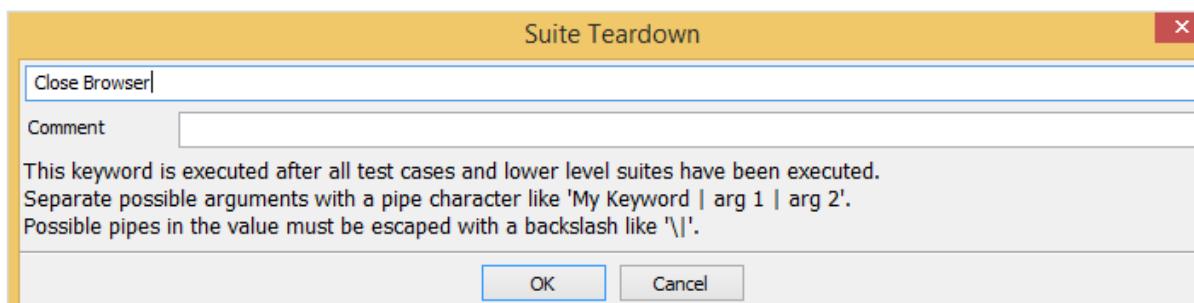

**Open Login Page** user-defined keyword has the following details:

```
*** Keywords ***
Open Login Page
[Arguments]    ${loginpage}    ${browser}
Open Browser    ${loginpage}    ${browser}
Maximize Browser Window
Title Should Be    Login Page
```

Now, we will create **Suite Teardown** for the suite.

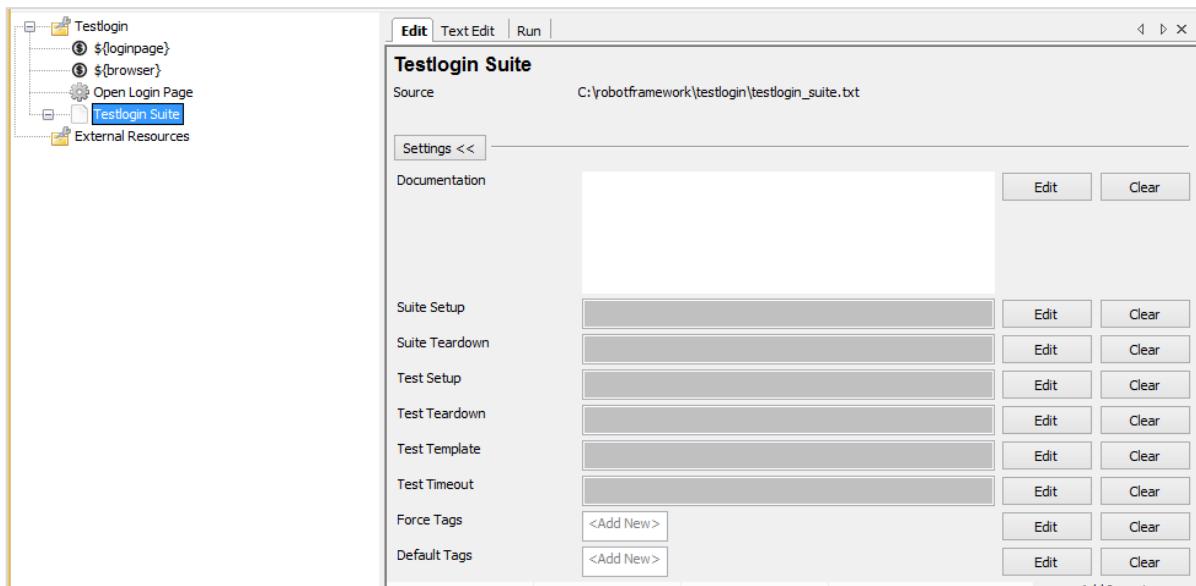

Click Edit for Suite Teardown and enter the details:

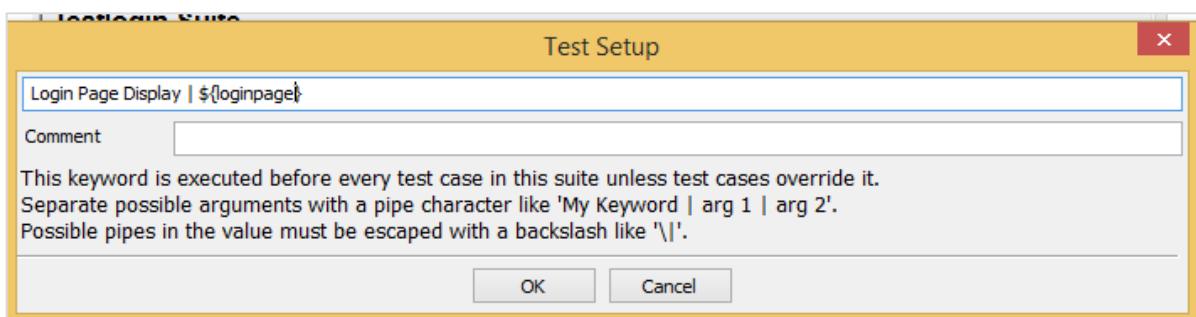

For Suite teardown, we are directly using library keyword, which will close the browser. Click OK to save the suite teardown.

Now, click the Testlogin Suite we have created.

Let us now create a setup for the test suite – Test Setup. This setup needs to get executed first.

Click Edit for Test Setup and enter the details.

For the Test Setup, we have created User defined Keyword called **Login Page Display**, which will take the argument as  **`${loginpage}`** as in the above screenshot.

Click OK to save the test setup.

Testlogin Suite

Source C:\robotframework\testlogin\testlogin\_suite.txt

Settings << Documentation Edit Clear

Suite Setup Suite Teardown Test Setup Test Teardown Test Template Test Timeout Force Tags Default Tags

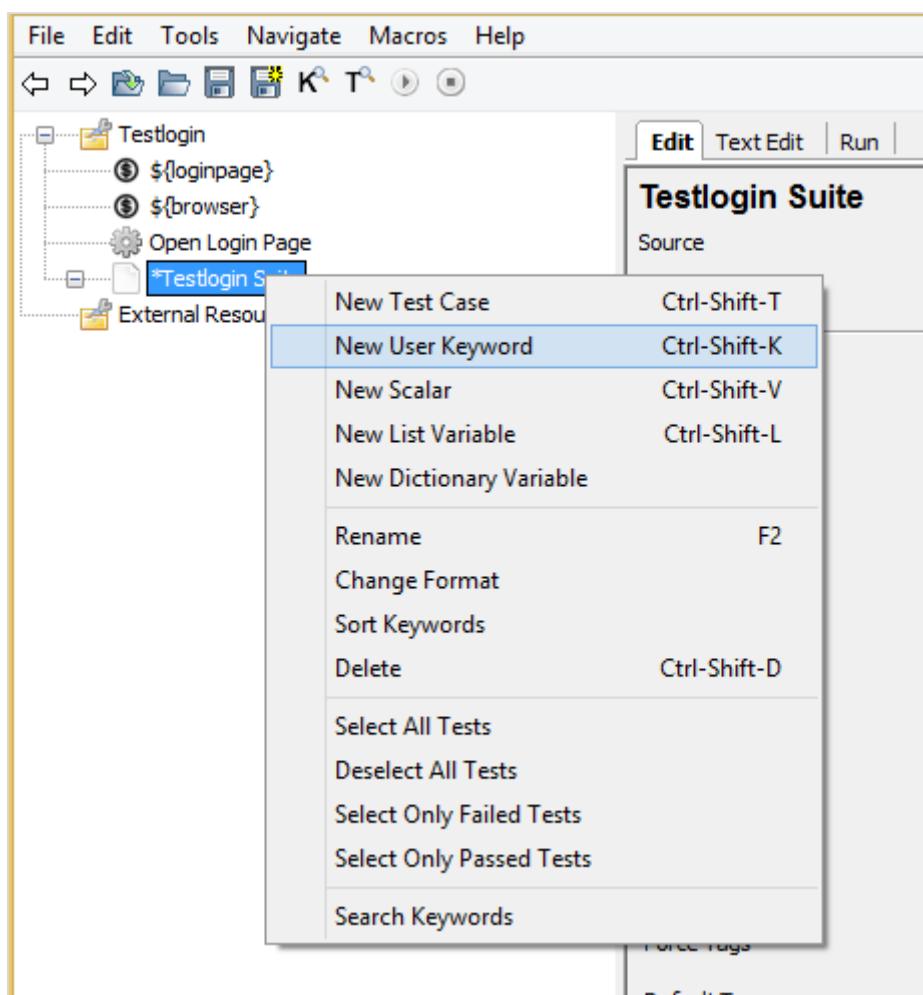

Login Page Display | \${loginpage} <Add New> <Add New>

Edit Clear Edit Clear

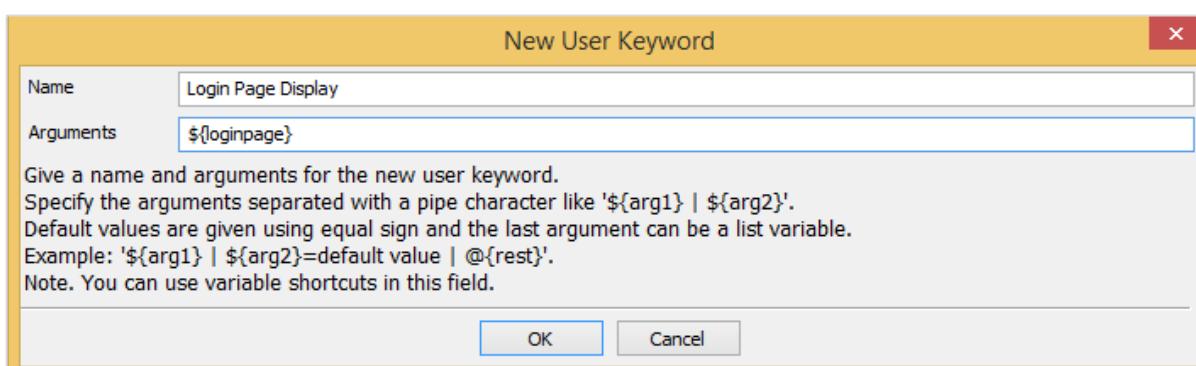

Import Name / Path Arguments Comment Add Import

Now, we need to create the user keyword **Login Page Display**.

Right-click on the test suite and click **New User Keyword** as shown below:

New User Keyword will display the screen as shown below:

Click OK to save the keyword.

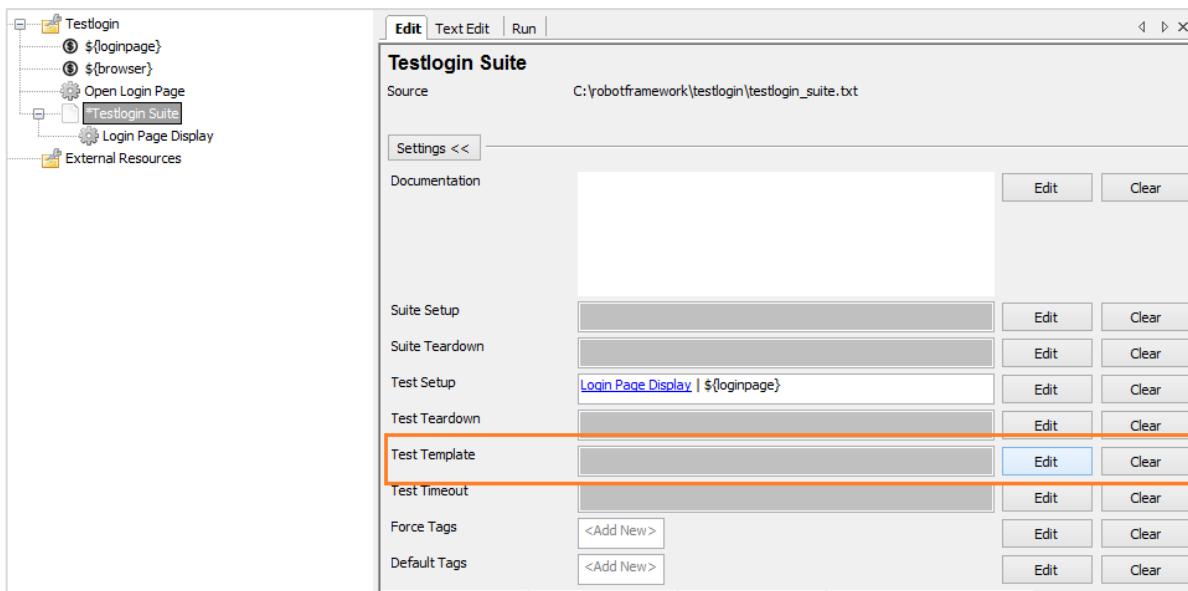

Let us now enter the keyword we need for the user keyword **Login Page Display**.

1	Go To	\${loginpage}
2	Title Should Be	Login Page
3		
4		
5		

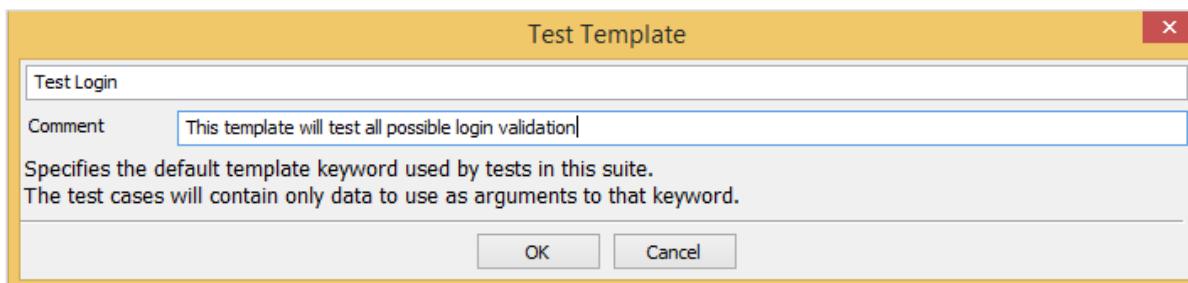

Here we want to go to the **loginpage** and check if the title of the page matches with the value given.

Now, we will add template to the test suite and create data driven test cases.

To create template, click on the suite and on right side click Edit for Test Template.

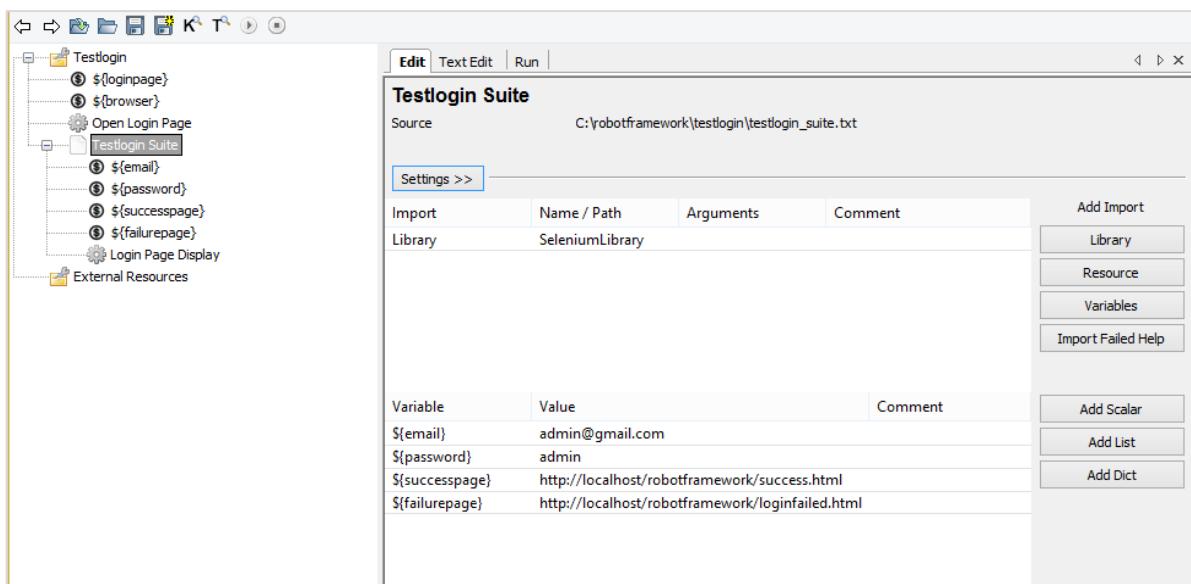

You will be directed to the following screen:

Test Login is again a user-defined keyword. Click OK to save the template.

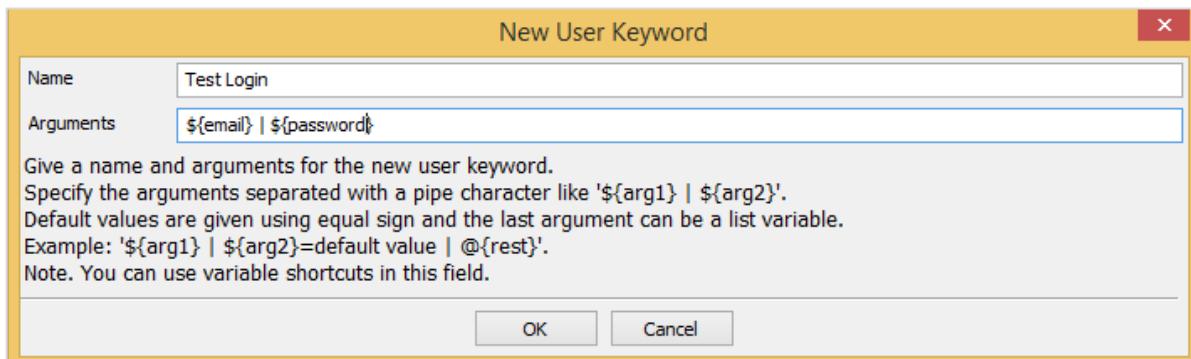

Before we create the Test Login keyword, we need some scalar variables. The scalar variables will have the details of the email-id, password, successpage, failurepage, etc.

We will create scalar variables for test suite as follows:

We have created email, password, successpage and failurepage scalar variables as shown in the above screenshot.

Now, we will create **Test Login** User defined Keyword. Right-click on the test suite and click on New User Keyword.

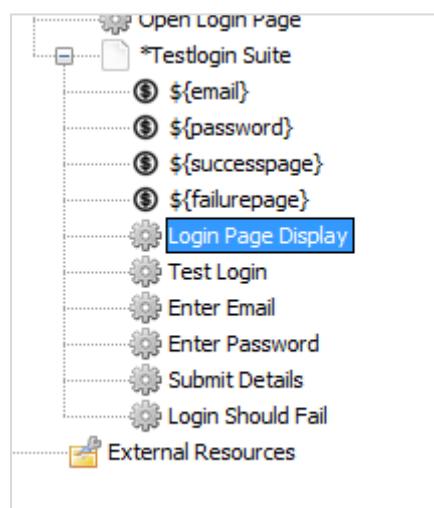

Click OK to save the keyword.

The following screenshot shows the keywords entered for Test Login:

	Enter Email	Arguments	Tags	Teardown	Return Value	Timeout
1	Enter Email	<code>#{email}</code>	<Add New>			
2	Enter Password	<code>#{password}</code>				
3	Submit Details					
4	Login Should Fail					
5						

**Enter Email, Enter Password, Submit Details** and **Login Should Fail** are User Defined Keywords, which are defined as follows:

## Enter Email

**Enter Email**

[Settings <<](#) [Find Usages](#)

Documentation [Edit](#) [Clear](#)

Tags [<Add New>](#) [Edit](#) [Clear](#)

Arguments [\\${email}](#) [Edit](#) [Clear](#)

Return Value Edit Clear

Timeout Edit Clear

1	Location Should Be	#{failurepage}	
2	Title Should Be	Login Failed	
3			
4			
5			
6			
7			

Now, we will write test cases, which will take different email id and password details to the template created.

The following is a list of test cases:

### Invalid email id Test case

	Email	Password		
1	abcd@gmail.com	\${password}		
2				
3				
4				
5				
6				

The email is passed with values abcd@gmail.com and \${password} is the password stored in the variable.

## Invalid Password

	Email	Password		
1	\${email}	xyz		
2				
3				
4				
5				
6				

## Invalid Email Id and Password

	Email	Password		
1	invalid	invalid		
2				
3				
4				
5				
6				

## Empty Email Id

	Email	Password		
1	\${EMPTY}	\${password}		
2				
3				
4				
5				
6				

## Empty Password

	Email	Password		
1	\${email}	\${EMPTY}		
2				
3				
4				
5				
6				

## Empty Email and Password

	Email	Password		
1	\${EMPTY}	\${EMPTY}		
2				
3				
4				
5				
6				

Now, we are done with the test cases and can run the same.

Go to the Run tab and click Start to execute the test cases.

```

Ending test: Testlogin.Testlogin Suite.Empty Email And Password

```

## Conclusion

We have seen here how to test a login page with different inputs, which will validate if the login is working fine or not. The details of how the execution takes place is given in the log section.
